Navitas Semiconductor

NVTS | NASDAQ | 2026-10-07

Q4 2027 model ceiling: USD 0.00

Analytical Base 38/60 = 63 | Technology optionality / Watchlist

20x quarter-plus-next-three fully expensed normalized GAAP operating profit including SBC and D&A, less end-window financial/contingent claims, divided by matched end-window economic shares. Common floor inside each of 16 operating outcomes; no cash addition or revenue-multiple substitution.

Coverage initiated at the owner's request. No holding was established by this research. Existing portfolio Base overrides remain protected.

All operating values are in USD m and shares in millions unless stated otherwise. Forecasts are analytical assumptions; issuer guidance and actual results are identified separately.

Writing-date snapshot: USD 11.29 per share (2026-10-07 15:24 EDT); 269.063 million common shares (2026-10-06, estimated post-close planning base); estimated equity capitalization USD 3,037.7 million. Archived Stock Analysis intraday quote. Estimated post-close common uses the October S-8 planning base of 269.062970M, including approximate closing shares; not an exact legal count, pending final adjustments. The derived September 28 pre-close reconciliation is 262.150241M. Model economic award reserves are separate. This dated common-share snapshot is separate from forecast diluted shares.

Decision in the model

Active horizon	Earnings window	F4Q OP	Multiple	Diluted shares	Ceiling
Q4 2027	Q4 2027 through Q3 2028	-84.4	20x	292.082	0.00

The ceiling is a model valuation, not a guaranteed trading price or a literal net-income P/E. Operating branches are weighted once. Where debt, preferred claims, conversion or equity floors make value nonlinear, the model values each coherent operating and funding state first, then weights those common-share outcomes.

Economic scope and matching claims

Consolidated legacy/high-power GaN and SiC plus probability-weighted Claros IVR, with acquired fixed costs retained even if commercialization fails.. 20x quarter-plus-next-three fully expensed normalized GAAP operating profit including SBC and D&A, less end-window financial/contingent claims, divided by matched end-window economic shares. Common floor inside each of 16 operating outcomes; no cash addition or revenue-multiple substitution.

Financial claims and diluted shares follow the company-specific schedule below. Debt, preferred and minority claims are counted once. All financial model tables use USD m unless a different unit is stated.

Thesis

Navitas has a credible place in the shift toward higher-voltage AI power distribution, and the October 6 closing of Claros expands its reach to the final low-voltage conversion stage next to the processor. The engineering opportunity is substantial. The current earnings are not. Q2 revenue was $10.529 million against a $27.190 million GAAP operating loss, and the acquired business adds costs before its expected 2028-29 commercial ramp.

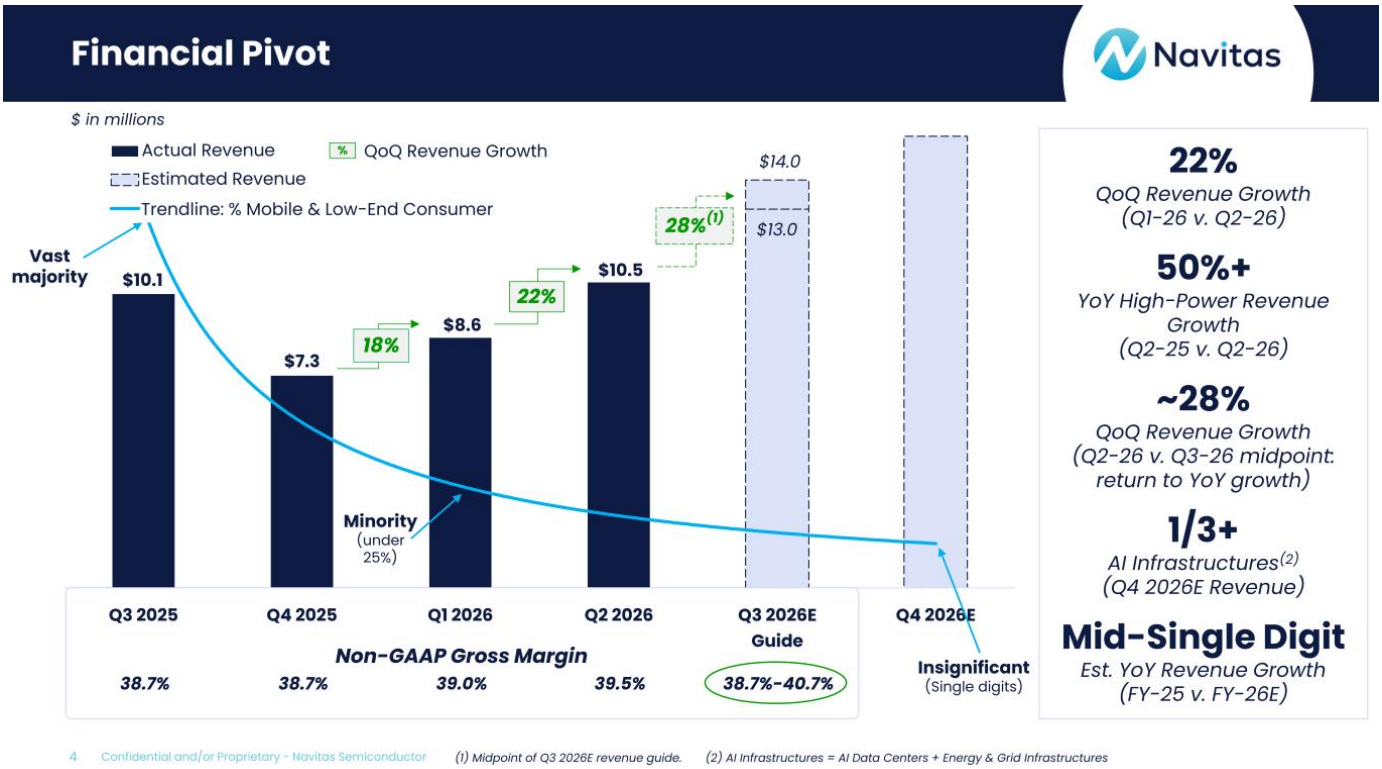

The active Q4 2027 ceiling is **Nil under 20x forward-four-quarter fully expensed operating profit**. This window means Q4 2027 through Q3 2028. Each of 16 operating outcomes is valued separately, with common equity floored at zero before weighting. The positive distribution first appears at Q4 2028, about $0.19 per share, and reaches approximately $4.55 at Q1 2030. These results do not value liquidation cash, patents or market option value. They also do not substitute a revenue multiple because the near-term operating-profit result is unhelpful.

The analytical Base is **63**, or 38 raw points out of 60 after risk adjustments. This is technology optionality with a funded development runway, not an established profitable bottleneck franchise. The model gives nonzero probabilities to qualified-device growth, IVR commercialization and modest pricing power. Its main obstacle is the cost and time needed to convert those opportunities into fully expensed earnings.

What the business sells

Navitas designs power semiconductors rather than complete data-center power systems. GaN products address fast switching, integration and compact conversion. High-voltage and ultra-high-voltage SiC products address different blocking-voltage, robustness and power requirements. Claros adds integrated voltage regulation at the processor. A semiconductor sold into a full powertrain earns its component invoice, not the customer's entire system selling price.

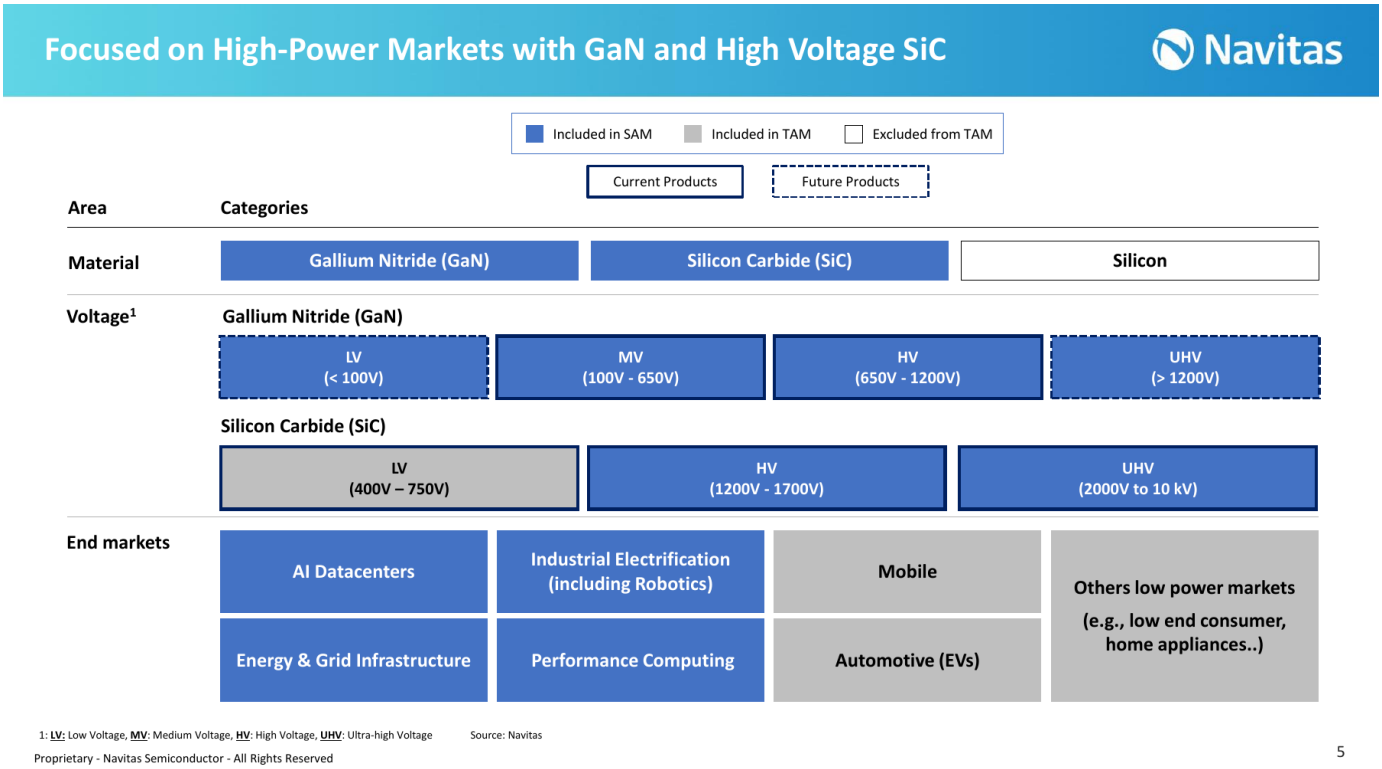

The legacy mobile and low-end consumer business has contracted sharply. Revenue fell from $83.302 million in 2024 to $45.916 million in 2025. Management is redirecting the company toward AI infrastructure, grid and storage, performance computing and industrial electrification. Q1 2026 revenue of $8.598 million recovered to $10.529 million in Q2; that recovery is from a low base. The Q2 presentation expects AI infrastructure and grid to exceed one-third of Q4 sales while mobile becomes insignificant. Those are issuer expectations, not an order ledger.

The legacy mobile decline and high-power growth must be modeled separately.

Original July 27 presentation, page 4. The mix transition supports a different product opportunity, but year-over-year high-power growth does not equal consolidated operating leverage.

Navitas reports one segment. The model's five reference revenue vectors are analytical allocations: AI AC/DC and sidecar SiC, in-tray GaN, grid/storage/SST SiC, performance-computing GaN, and industrial/residual products. Customer demand, pricing and margins are not separately disclosed at that level. In Q2, distributor A represented 71% of revenue; Hong Kong billing represented 76%. Billing geography is not end-user demand geography, and distributor concentration creates collection, inventory and allocation risk.

GaN and high-voltage SiC occupy different functions; voltage classes do not establish an awarded socket.

Original March presentation, page 5. Voltage classes identify possible applications; they do not establish design qualification or a customer's supplier allocation.

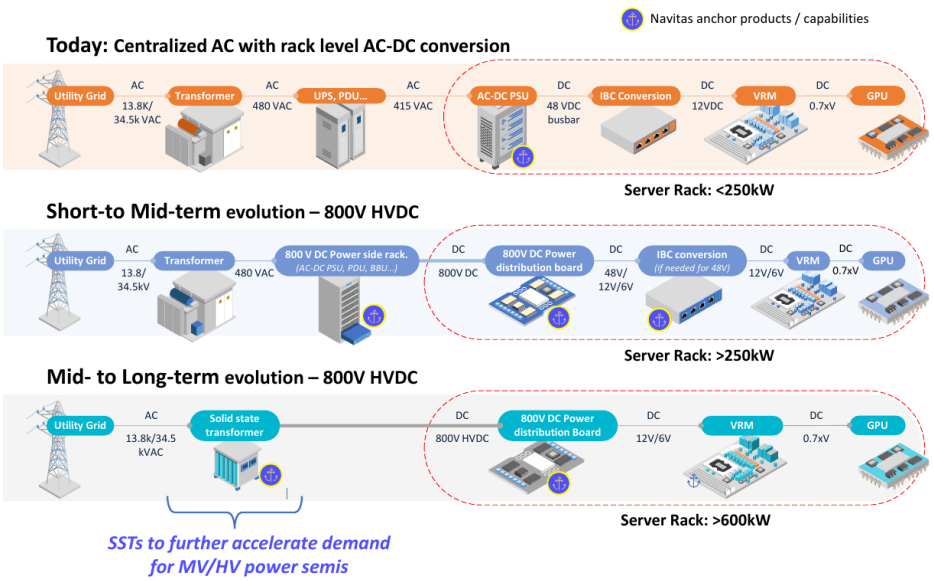

Why higher voltage changes the engineering

At the same delivered power, moving distribution from 50V to 800V reduces current by a factor of 16. That can reduce conductor losses and copper burden, but it does not improve complete-system efficiency by 256 times. Actual economics depend on the converter chain, isolation, switching losses, magnetics, cooling, fault protection, redundancy and serviceability.

A 650V continuous-rated transistor is not an 800V continuous-blocking transistor. It can participate in a higher-voltage architecture only with the appropriate multilevel, split-rail or voltage-sharing topology and validated stress margins. Two switches in a conventional half bridge do not simply add their voltage ratings. GaN and SiC therefore compete and complement each other at specific stages; neither material wins every conversion duty.

AI Datacenters: Architectural Shift to Multi-MW Racks

Navitas

Energy efficiency	Typical power tree	Wideband Gap content per MW
80-85%	95+% Silicon-based	-
Up to 90%	Significant GaN / SiC	$10K-$20K
Over 90%	Accelerating GaN / SiC	$25K-$35K

Note: PDU – Power Distribution Unit; PSU – Power Supply Unit; BBU – Battery Backup Unit; UPS – Uninterrupted Power Supply; IBC – Intermediate Bus Converter; VRM - Voltage Regulator Module

9

Architectural alternatives and issuer efficiency boundaries; converter stages cannot be double-counted.

Original March presentation, page 9. These are issuer architecture and efficiency estimates; compare the same input/output boundary and delivered load before adopting a system claim.

The July roadmap separates four steps. First, higher-power AC/DC power supplies create SiC opportunities. Second, 800V sidecars introduce another conversion stage. Third, native 800V trays create higher-density GaN opportunities. Fourth, grid-to-core solid-state transformation can add ultra-high-voltage content later. The presentation places sidecar acceleration around mid-2027, native-tray acceleration into 2028, and SST at 2028 or later. Existing grid and storage products can earn revenue before full SST adoption.

Four roadmap stages have different commercial timing. Grid SST is later than initial sidecar devices.

Original July presentation, page 6. A roadmap is not four additive customer orders. Timing and paid content are modeled by stage.

The April 21 Irrational Analysis article correctly directs attention to compact integration, protection and reliable power density when additional phases and board area become expensive. Its device ranking is not evidence of monopoly pricing. The preserved technical review corrects several important comparisons: SOA pulse duration is not switching frequency; maximum heat dissipation is not useful converter output; reverse-conduction curves do not directly measure maximum delivered power; and external driver supply differs from transistor gate threshold. TI and Infineon also offer integrated alternatives. These observations support the qualified-volume probability already modeled, with 100% overlap rather than a second earnings increment.

Qualified output is the supply constraint

GlobalFoundries' September 1 announcement distinguishes initial wafers in September, internal samples in October and strategic-customer samples by year end. These milestones are progress. They are not equivalent to stable qualified yield, high-volume customer acceptance or unlimited capacity. Navitas management's 2027 ramp depends on completing those gates and delivering the same electrical and reliability performance after the manufacturing transition.

TSMC buffer inventory, GlobalFoundries GaN production and a Magnachip SiC licensing/manufacturing relationship address different supply risks. The Q2 discussion says purchased TSMC inventory supports the business through 2029 and beyond under then-current assumptions. That is not a guarantee for every growth scenario. SiC also uses X-FAB, while management described Claros' digital process relationship with Samsung. Wafer, package, test and application qualification all matter; nameplate wafer capacity is not saleable customer-qualified devices.

TSMC buffer inventory, GF qualification and Magnachip are separate supply routes; none proves unlimited saleable capacity.

Original July presentation, page 5. The supply routes support one modeled qualification event; their capacities are not independently added as demand shocks.

The new-model reference uses $6,500 of SiC, $10,000 of GaN and $11,000 of grid-stage content per company-served MW equivalent. These choices sit within earlier issuer content ranges and avoid using the highest September descriptions for every stage. The model does not convert the entire AI market into Navitas revenue. One physical MW can contain different legitimate component invoices at different stages, but the same complete wallet must not be counted twice.

AI Data Centers / Energy & Grid Infrastructure: Content Estimates

	GaN + SiC	GaN	SiC	Comments
Total $ content per MW	**~ $25K - $35K**	~ $10K - $15K	~ $15K - $20K	Estimate factoring ASP trend, redundancy and number of devices per system. Using same assumption as the base SAM (moderate penetration of AI Data Centers with total demand in 2030 of 219GW, 50% of AI D/C using 800V HVDC)
Inside AI Data Center		~ $10K - $15K Mostly driven by 800V HVDC	~ $5K - $8K Mostly driven by AC/DC PSU	Not factoring $2-3 of SiC JFET for circuit protection and hotswap
Outside Data Center (Energy & Grid Infra.)			~ $10K - $12K Mostly driven by SST, BESS	The energy grid re-architecture represents a very large opportunity for UHV (>2Kv) SIC and V-Gan (2030)

Proprietary - Navitas Semiconductor - All Rights Reserved

Original dollar content by stage; company capture, mix and actual accepted capacity remain model assumptions.

Original March presentation, page 11. These are estimated total device wallets. Company capture, accepted volume, redundancy and actual ASP remain separate questions.

Total SAM Growing at 60-75% CAGR to $3.5 – $5.4B in 2030

1. 2030 SAM: Base case assumes moderate penetration of AI datacenters with total 2030 demand of 219 GW, moderate adoption of GaN and SiC in energy & grid infrastructure; High case assumes accelerated penetration of AI datacenters with total 2030 demand of 298 GW, faster growth of energy & grid infrastructure power electronics with accelerated adoption of GaN and SiC

Proprietary - Navitas Semiconductor - All Rights Reserved

Issuer serviceable-market scenarios are opportunity estimates, not Navitas revenue forecasts.

Original March presentation, page 6. These market envelopes are checked for scale; they are not multiplied by a guessed company market share.

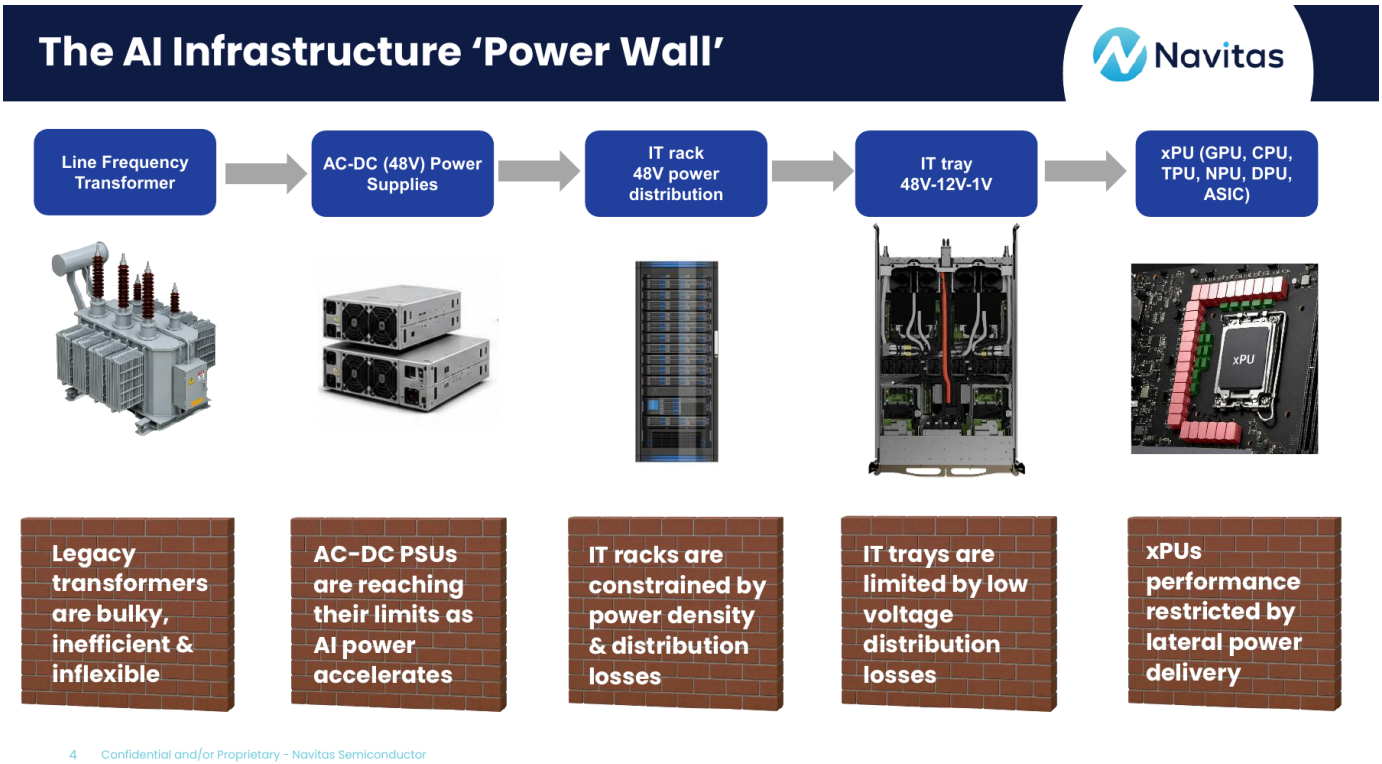

Reference 2027 sales are $83.3 million: $19.5 million SiC, $20 million in-tray GaN, $8.8 million grid devices, $27 million performance computing and $8 million industrial/residual products. This is already a strong ramp from 2026. Reference 2028, 2029 and 2030 revenue reaches $168 million, $255 million and $348.5 million, respectively. Quarterly allocation uses 19%/23%/27%/31%, a deliberate ramp profile rather than a claim of stable historical seasonality.

The 65% qualified-volume branch adds $16.9 million, $42 million, $80.75 million and $125.5 million of conditional annual sales in 2027-30. In 2028, the selected $42 million comes from an additional 2,000 MW of SiC, 1,500 MW of GaN and 1,000 MW of grid component equivalents; the conditional revenue bound is $20-65 million. At 55% incremental gross margin, 6% variable operating expense and $3 million of fixed support costs, conditional operating profit is $17.58 million. Its probability-weighted contribution is $11.427 million. Additional capex and working capital are also funded.

A separate 35% pricing event applies a bounded 2-5% premium, selected 3%, to half of reference AI/grid sales that could be repriced. It excludes incremental ramp volume, IVR and the PC/industrial pool. Manufacturing, testing and expedition consume 30% of the premium, with another 2% for support. The 2028 weighted operating-profit increment is only $0.439 million. Q2 management emphasized adoption rather than blanket price increases, so an industry bottleneck does not justify an aggressive universal premium.

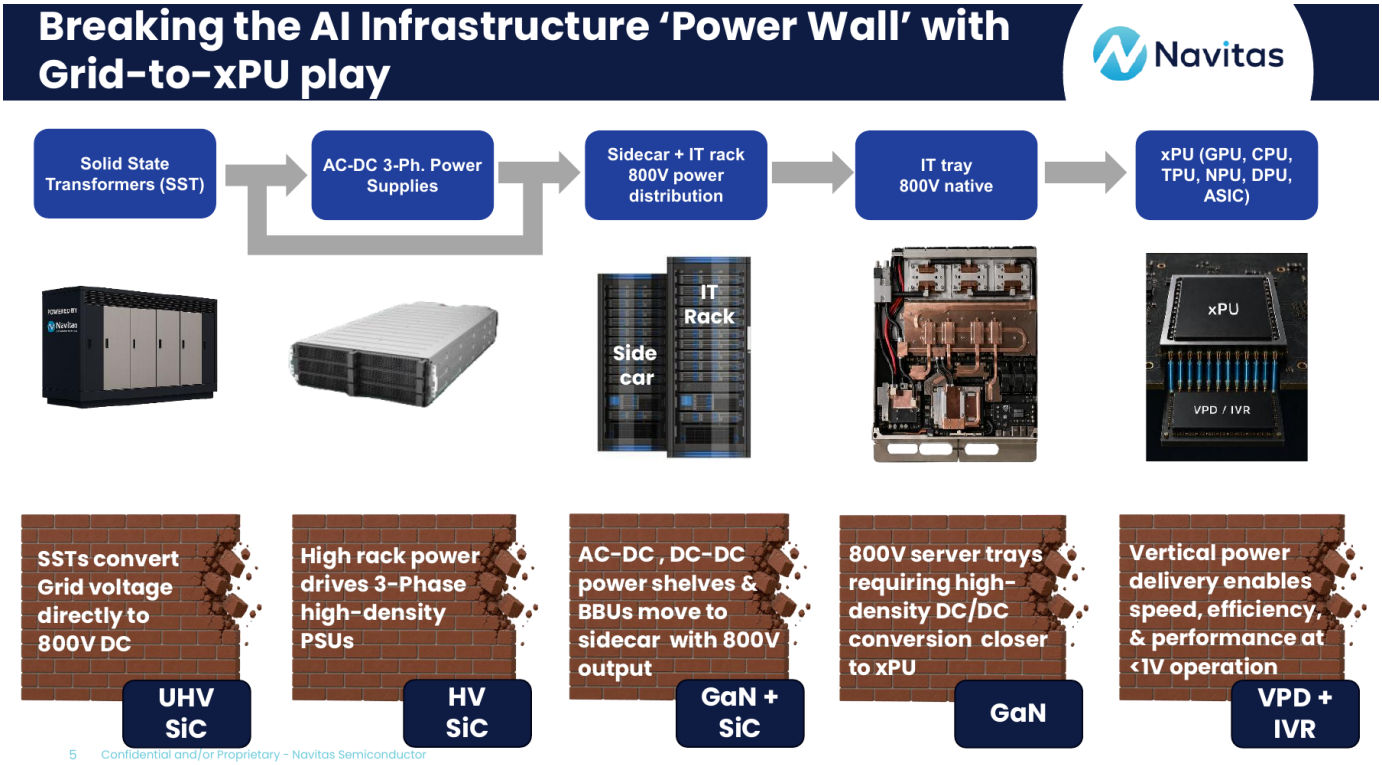

Claros moves the final conversion stage closer to the processor

Claros closes a different gap. Very high current at a sub-1V processor rail makes distance, impedance, transient response and cooling expensive. Its integrated regulator combines power, control and passives. Management described 3.3V-to-core conversion and modular 40A cells; the cell array can scale toward thousands of amps. Packaged IVR can sit near or beneath the processor, while embedded implementations can move conversion into the board or substrate. VPD and EPD are possible implementations, not two separate revenue streams.

The final low-voltage high-current stage has different constraints from upstream conversion.

Original August acquisition presentation, page 4. Upstream transmission and final-stage current delivery are distinct engineering problems.

SiC, GaN and IVR are distinct sold-product stages, not three shares of the same module price.

Original August acquisition presentation, page 5. Combining a portfolio does not prove one supplier wins every stage or every complete system.

The October 6 filing confirms the acquisition closed. The accompanying CEO letter retains an estimated additional $3.5 billion of 2030 IVR serviceable market, bringing the identified portfolio opportunity above $8 billion with JFET. That is management's addressable-market claim. It does not disclose contracted IVR economics, named procurement awards or qualified production volume. The model does not assign revenue by multiplying that market size by an arbitrary share.

Anticipated Benefits include Grid-to-xPU, More Than 2x SAM, Expanded Capabilities

- **Navitas 2.0 and grid-to-xPU:** same strategy and focus on AI Infrastructures with high power products, broadened portfolio
- **Doubling SAM expansion to $8B upon transaction completion**
- Claros' VPD & IVR technologies will complement GaNFast in delivering highest power density closest to the xPU. Together with GeneSiC, Navitas offers **complete portfolio to power from Grid-to-xPU**
- **Deepens Navitas' engagement** with hyperscalers, merchant power OEM/ODM and xPU vendors by solving power density close to the xPU
- **Expands technology, engineering and capabilities** in digital controller for power conversion, integration of passives, & advanced 2D/3D packaging

The $3.5B IVR market addition is an issuer estimate, not contracted company sales.

Original August presentation, page 6. The market addition is an opportunity estimate; the model separately builds accepted component equivalents and costs.

The 55% IVR event begins sales in H2 2028, with $10 million in Q3 and $20 million in Q4. Conditional annual revenue is $90 million in 2029 and $180 million in 2030. A transparent equivalent build is 0.1/0.3/0.6 million processors at $300 of sold regulator content. Neither the processor count nor the wallet is a disclosed customer order or price. The 2028 bound is 0.05-0.2 million equivalents at $200-400 each, or $10-80 million.

Stronger Financial Model

- Current organic plan and short-to mid-term (2027/2028) financial model remain unchanged
- Revenue acceleration expected from VPD & IVR (2028/2029), alongside organic AI Infrastructures driven GaN and SiC growth
- Remain committed to path to profitability with no anticipated material change to timeline

Navitas + claros

Claros revenue acceleration is framed for 2028-29; no revenue pulled into 2027.

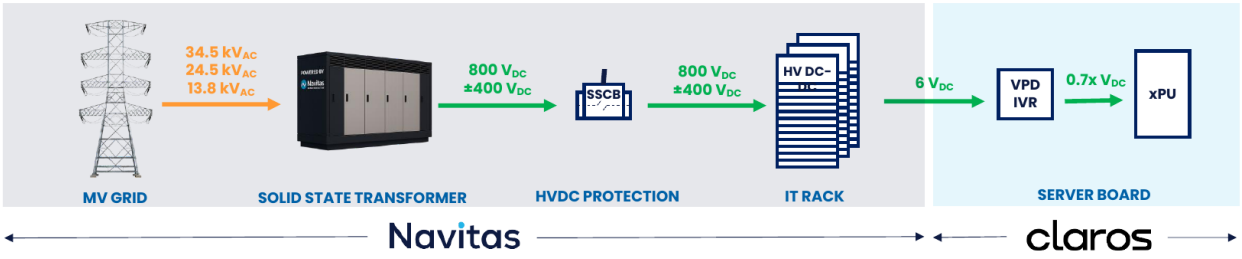

Original August presentation, page 7. The filing's near-term continuity language concerns management's plan; it does not eliminate new acquired costs from this fully expensed model.

Conditional IVR gross margin is 55%, 60% and 62% in 2028-30, with variable operating expenses equal to 15% of sales. The reference bears acquired fixed engineering costs of $12/$16/$20/$24 million in 2027-30, ordinary acquired-award SBC of $4/$4.5/$5/$5.5 million and purchased-intangible amortization of $15 million annually even if the commercial event fails. The $15 million amortization is a $90 million identifiable-intangible proxy over six years, not a disclosed purchase-price allocation. Goodwill is not amortized.

Employee milestone compensation is also a cost. The model expenses $28.9 million over eight quarters from Q4 2026 through Q3 2028 in the successful commercial event, using the same 55% probability for its economic shares. The actual accounting and vesting timing could differ. In 2028 the conditional incremental IVR operating profit is only $1.1625 million after $10.8375 million of that compensation. It rises to $40.5 million in 2029, before weighting. This is why a technically useful acquisition can still delay attractive fully expensed earnings.

Navitas & Claros Will Completes 'Grid-to-xPU' AI Power Portfolio

- Navitas + Claros create a complete Grid-to-xPU power platform
- Combining Navitas' GaN and HV & UHV SiC leadership with Claros' VPD & IVR technology strengthens leadership in AI infrastructure
- Breaking the AI infrastructure Power Wall and enables the next generation of AI computing

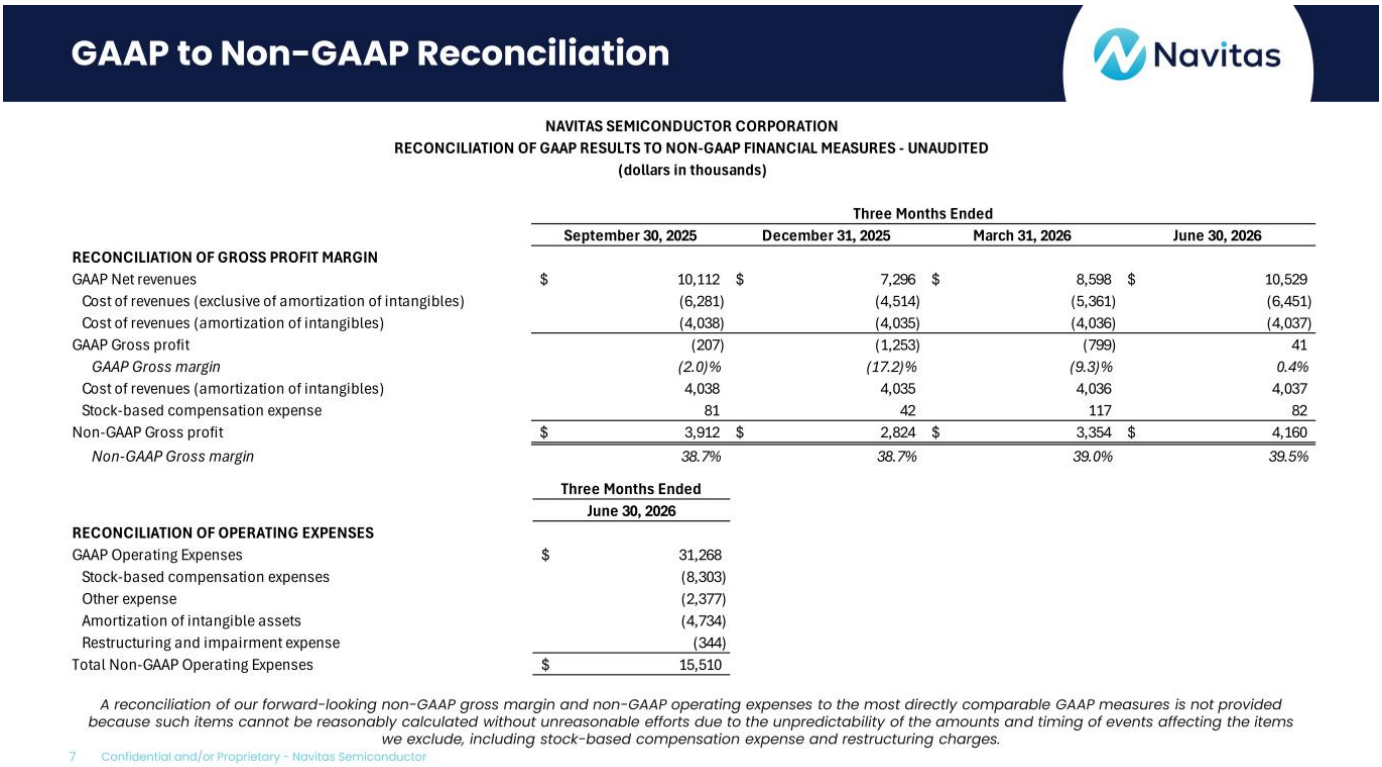

8 Confidential and/or Proprietary - Navitas Semiconductor

VPD and EPD implement final-stage power delivery; no named xPU award is established.

Original August presentation, page 8. No named xPU design, buyer allocation or exclusivity is inferred from the diagram.

From reported results to a fully expensed model

Q2's reported gross profit was only $0.041 million after $4.037 million of cost-of-sales intangible amortization. Non-GAAP gross profit was $4.160 million, or 39.5%. Total operating loss was $27.190 million. The income statement presents cost of sales before acquired amortization, while the gross-margin reconciliation assigns $4.037 million of that amortization to cost of sales. The $4.734 million total amortization must therefore be deducted only once: $4.160 million non-GAAP GP less $8.385 million total SBC, $4.734 million amortization, $15.510 million adjusted operating expenses and $2.721 million other/restructuring costs reconciles exactly to the $27.190 million operating loss. The model moves all purchased-intangible amortization and SBC into separately visible expense rows for comparability, without changing operating-profit scope. It does not value adjusted EBITDA.

GAAP to Non-GAAP Reconciliation

Navitas

NAVITAS SEMICONDUCTOR CORPORATION
RECONCILIATION OF GAAP RESULTS TO NON-GAAP FINANCIAL MEASURES - UNAUDITED
(dollars in thousands)

	Three Months Ended			
	September 30, 2025	December 31, 2025	March 31, 2026	June 30, 2026
RECONCILIATION OF GROSS PROFIT MARGIN				
GAAP Net revenues	$ 10,112	$ 7,296	$ 8,598	$ 10,529
Cost of revenues (exclusive of amortization of intangibles)	(6,281)	(4,514)	(5,361)	(6,451)
Cost of revenues (amortization of intangibles)	(4,038)	(4,035)	(4,036)	(4,037)
GAAP Gross profit	(207)	(1,253)	(799)	41
GAAP Gross margin	*(2.0)%*	*(17.2)%*	*(9.3)%*	*0.4%*
Cost of revenues (amortization of intangibles)	4,038	4,035	4,036	4,037
Stock-based compensation expense	81	42	117	82
Non-GAAP Gross profit	$ 3,912	$ 2,824	$ 3,354	$ 4,160
Non-GAAP Gross margin	*38.7%*	*38.7%*	*39.0%*	*39.5%*

	Three Months Ended
	June 30, 2026
RECONCILIATION OF OPERATING EXPENSES	
GAAP Operating Expenses	$ 31,268
Stock-based compensation expenses	(8,303)
Other expense	(2,377)
Amortization of intangible assets	(4,734)
Restructuring and impairment expense	(344)
Total Non-GAAP Operating Expenses	$ 15,510

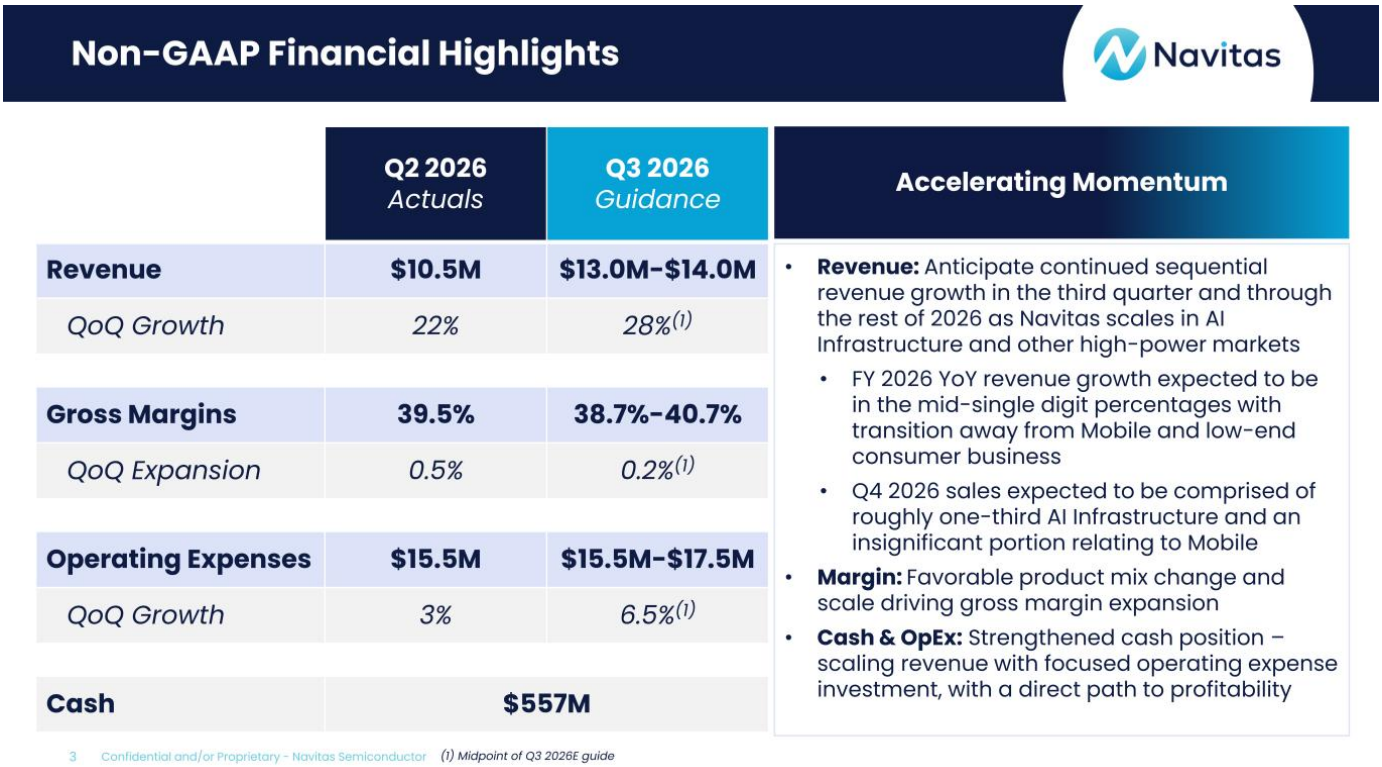

A reconciliation of our forward-looking non-GAAP gross margin and non-GAAP operating expenses to the most directly comparable GAAP measures is not provided because such items cannot be reasonably calculated without unreasonable efforts due to the unpredictability of the amounts and timing of events affecting the items we exclude, including stock-based compensation expense and restructuring charges.

7 Confidential and/or Proprietary - Navitas Semiconductor

Original GAAP reconciliation: purchased-intangible amortization and SBC remain expenses.

Original July presentation, page 7. Both cost-of-sales and operating-expense adjustments must be reconciled before extrapolating an adjusted margin.

The Q3 revenue guide is $13-14 million, non-GAAP gross margin 38.7-40.7%, and non-GAAP operating expenses $15.5-17.5 million. The midpoint revenue and margin are used, but the expense forecast adds $2.8 million of retained legal/other support as an analyst proxy, SBC and acquired-intangible amortization. The $2.8 million is a conservative allowance informed by Q2's $2.377 million other expense plus $0.344 million restructuring, not company guidance that every adjustment repeats. Q3 modeled operating loss is $25.8405 million. Reference Q4 revenue of $16.2 million produces full-year revenue of $48.827 million, consistent with mid-single-digit issuer growth guidance; Claros costs then enter the model.

Revenue and margin growth are attributable non-GAAP guidance, not GAAP operating-profit guidance.

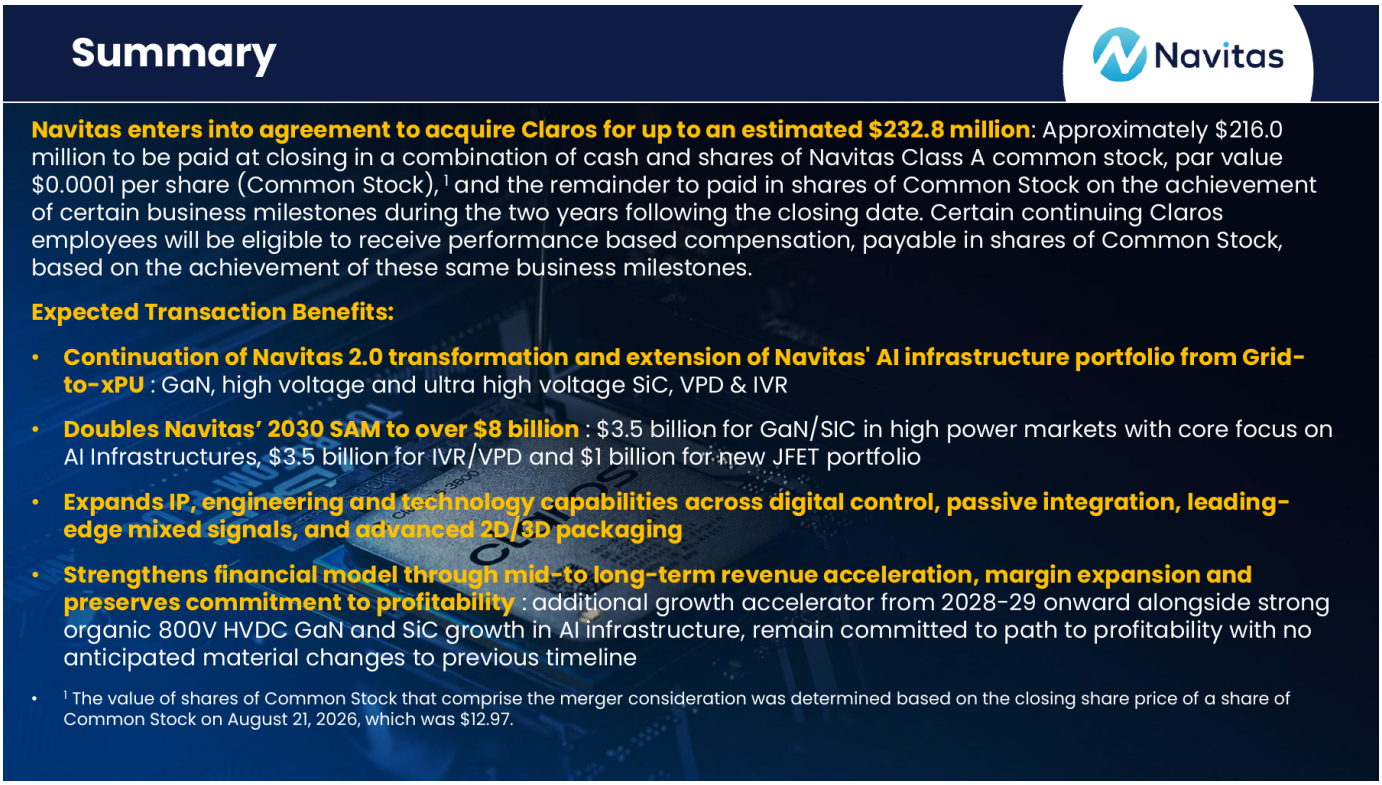

Original July presentation, page 3. The guide supports near-term sales calibration, not a positive GAAP operating-profit conclusion.

Core non-SBC R&D and SG&A total $70/$77/$85/$94 million in 2027-30 and already include ordinary depreciation. Core SBC is $33/$35/$38/$41 million. Ordinary depreciation is therefore added back only when calculating operating cash flow, not excluded from operating profit. Legacy purchased-intangible amortization follows the filed remaining schedule rather than annualizing Q2's unusually high charge indefinitely. Acquired amortization and costs remain separate.

After the probabilities, active annual revenue is about $92.7 million in 2027, $207.8 million in 2028, $350.5 million in 2029 and $520.0 million in 2030. Corresponding operating profit is approximately minus $109.6 million, minus $66.5 million, minus $3.9 million and plus $66.5 million. These are analytical assumptions, not management forecasts. Management's earlier break-even comment concerned its then-current adjusted cost structure, not this post-acquisition fully expensed model.

Acquisition cash, issued stock and employee claims

The S-4 estimated $126.4 million of cash consideration, 6.912729 million closing shares and up to 1.289869 million milestone shares. It separately described $28.9 million of employee PSUs valued at the transaction reference price, equivalent to approximately 2.228219 million shares. The October assumed-plan filing registers 2.395762 million shares for acquired options. These claims are economically distinct.

August terms used a dated share reference price. October 6 closing supersedes the pending language in this original exhibit.

Original August presentation, page 3. The acquisition closed October 6; the original exhibit's pending language is historical. Final cash and share adjustments remain an open reconciliation item.

The October S-8 planning denominator of 269.062970 million combines dated legal common with estimated closing shares. Subtracting the S-4 closing count gives a derived September 28 common count of 262.150241 million. This is labeled a reconciliation, not a directly printed exact post-closing count. The header market capitalization uses the estimated post-close 269.062970 million planning base, matching the acquisition's completed status; final adjustments remain unknown. The model adds existing 7.751 million RSUs, 1.337494 million options, acquired options and a 1.2 million quarterly net-new award/ESPP allowance. The future path does not add those awards again when they vest. The latest outstanding-award roll-forward is unavailable, so using all June awards against a later legal count may overreserve up to the 1.069853 million increase in common shares since June. This is a conservative upper reserve, with an explicit share-count sensitivity, rather than an exact claim that every June award remains outstanding. The 35 million equity-plan registration is unissued capacity and is not automatically placed in the denominator.

Milestone merger shares and employee shares enter only the successful IVR outcome. The purchase cash leaves once in Q4 2026; there is no additional deduction for the entire transaction's quoted equity value. Ordinary and acquired option exercise proceeds are assigned zero, a conservative choice alongside full economic share reserves. The previous SPAC earnout was settled in Q2 and is not resurrected as another future liability. Its large fair-value expense was below operating profit and is not capitalized into the operating model.

Can the balance sheet fund the wait?

June unrestricted cash was $557.409 million. Restricted cash of $0.863 million is excluded. Most of the improvement came from equity issuance; it was not generated by operations. First-half operating cash flow was negative $48.348 million. Existing inventory, wafer prepayments and remaining ATM authorization are not additional liquid cash.

Each operating outcome begins with that filed balance and funds the cash acquisition, a reserved $5 million Magnachip investment, transaction expenses, operating losses, capex, taxes and working capital. The model includes $10 million foundry-capacity prepayments in Q1 2027 and Q1 2028 as explicit liquidity stresses. Normal annual capex is $20/$25/$30/$32 million in 2027-30, with additional conditional ramp and IVR investment. The June equipment payable is within forecast capex, not counted twice.

Working capital rises by 60% of quarterly revenue growth above the Q2 level, using changes rather than charging the cumulative balance repeatedly. Operating cash flow adds back SBC, ordinary depreciation and purchased-intangible amortization once. Cash interest income is zero. Financial lease principal of $0.620 million is repaid on the modeled schedule. Ordinary operating lease costs remain in operating expense and are not deducted again as financing debt.

All 16 paths remain funded through 2030; the lowest cash balance is about $153.8 million. No new equity financing is required in the selected outcomes. The hypothetical $100 million financing backstop is consequently unused and does not add cash, shares or a funding-probability haircut to value. Larger acquisition adjustments, redesigns, customer delays or litigation costs can still consume this margin. A positive cash balance is not a reason to add the entire cash balance to the operating-profit ceiling under the selected method.

Competition, downside and decision gates

Navitas competes against integrated and discrete alternatives from TI, Infineon, Renesas, Innoscience and others in GaN; SiC competitors include Infineon, Wolfspeed, onsemi, ROHM and STMicroelectronics. Final-stage regulation competes with established controllers and power-delivery ecosystems, including ADI/Empower and Monolithic Power. Suppliers can answer a performance advantage with better integration, another topology, lower package costs or more phases where space permits. A catalogue advantage must survive thermal, dynamic and reliability tests before it becomes a commercial moat.

The 25% adverse state combines a 15% loss of reference AI/grid sales, a three-point gross-margin reduction on that eligible pool, $3 million annual legal costs and a hypothetical $20 million settlement paid in Q4 2028. The settlement is bounded at $10-40 million; it is not an estimate of actual damages. Wolfspeed's patent complaint and Renesas' trade-secret complaint are unresolved allegations. The settlement claim and its cash payment are never deducted twice at the same valuation date.

Key evidence that would improve the model is accepted good-unit output at GF, repeated customer shipments, an independently understandable product margin bridge, named IVR economics, final acquisition accounting and lower share growth. Evidence that would weaken it includes qualification slippage, a customer architecture using less Navitas content, distributor inventory ahead of demand, litigation restrictions or an operating expense trajectory above the modeled ramp.

The October 20 issuer webinar is a useful architecture and product-information catalyst. Its slides may clarify the scope and power-density claims. It should not be treated as a purchase order. At present, the model recognizes a real technical opportunity and a substantial cash runway, while requiring profitable commercial scale before giving it a positive near-term earnings ceiling.

Material assumption sensitivities

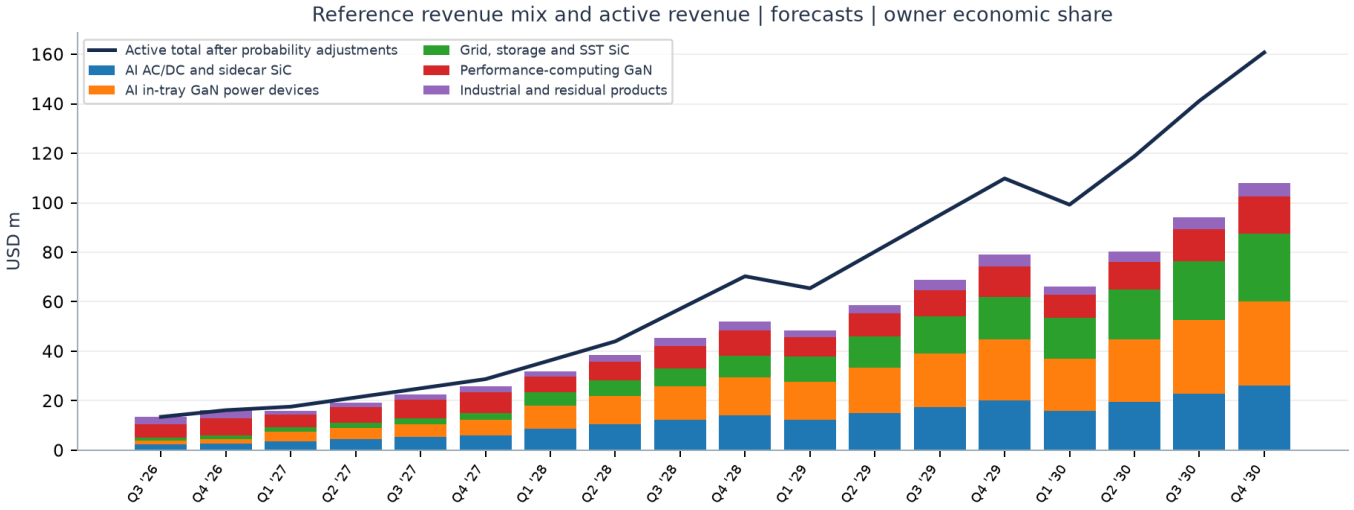

Varying acquired-intangible amortization from the selected $15 million annually to $7.5 million or $24 million changes the Q1 2030 ceiling to about $4.97 or $4.05, respectively. The active Q4 2027 result remains Nil. These are valuation-only sensitivities; amortization is noncash, so the direct funding effect is limited to taxes. Higher or lower acquired cash operating costs would directly affect both earnings and cash. Raising the qualified-volume probability from 65% to 80% lifts Q1 2030 to about $5.03; raising IVR commercialization from 55% to 80% lifts it to about $5.84. Raising the combined adverse-state probability to 80% lowers it to about $3.60. These changes are isolated sensitivities, not alternative adopted forecasts.

Removing the maximum 1.069853 million potential overlap between June awards and later issued common changes the Q1 2030 ceiling from $4.5494 to $4.5655. An adverse settlement of $40 million rather than $20 million reduces the worst funded cash balance by another $20 million, to approximately $133.8 million; it does not change positive default ceilings because payment precedes their matched claim dates. The hypothetical one-time settlement is a normalized nonrecurring financial claim and cash outflow, while ordinary legal support remains expensed in operating profit. Neither is a reported liability estimate.

Score arithmetic

Category	Points	Evidence / treatment
Core thesis	16	Integrated GaN/SiC plus final-stage IVR capability, but competitive qualification and acquired integration remain unfinished.
Cycle	5	Legacy demand has contracted and profitable AI scale is still ahead.
TAM	9	Distinct grid, rack and processor sockets expand sold content without adding the full TAM to revenue.
Catalysts	3	2026 samples, 2027 accepted GaN devices and 2028 IVR programs.
Macro	7	Power scarcity supports engineering investment; export, funding and customer concentration remain risks.
Alpha	3	Separate technical performance, good output and fully expensed profit.
Risk classes	-5	Substantial losses, execution, acquisition accounting, share growth and litigation.
Total	38/60	Rounded Base 63. Both artifact and new workbook row use this score; this is not a manual override.

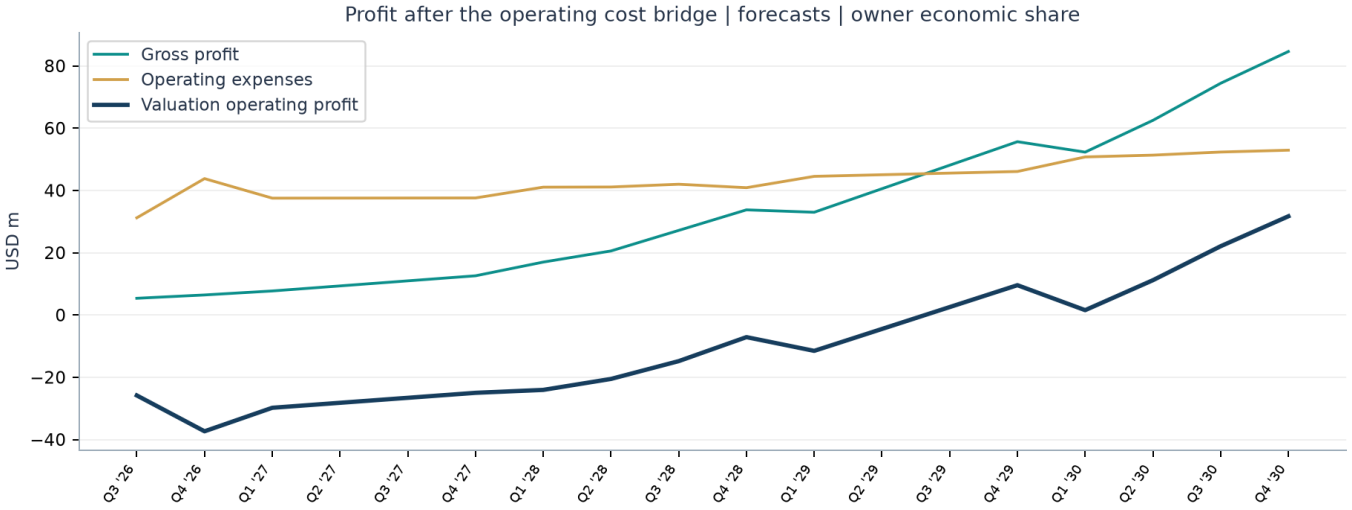

Revenue and business mix

Reference business vectors sum to the reference; the active total adds only probability-weighted net changes. Product allocations may be analytical proxies where issuers do not report product margins.

Quarter	Reference revenue	Weighted net change	Active revenue
Q3 2026	13.5	0.0	13.5
Q4 2026	16.2	0.0	16.2
Q1 2027	15.8	1.8	17.6

Q3 2030	94.1	47.1	141.2
Q4 2030	108.0	52.7	160.7

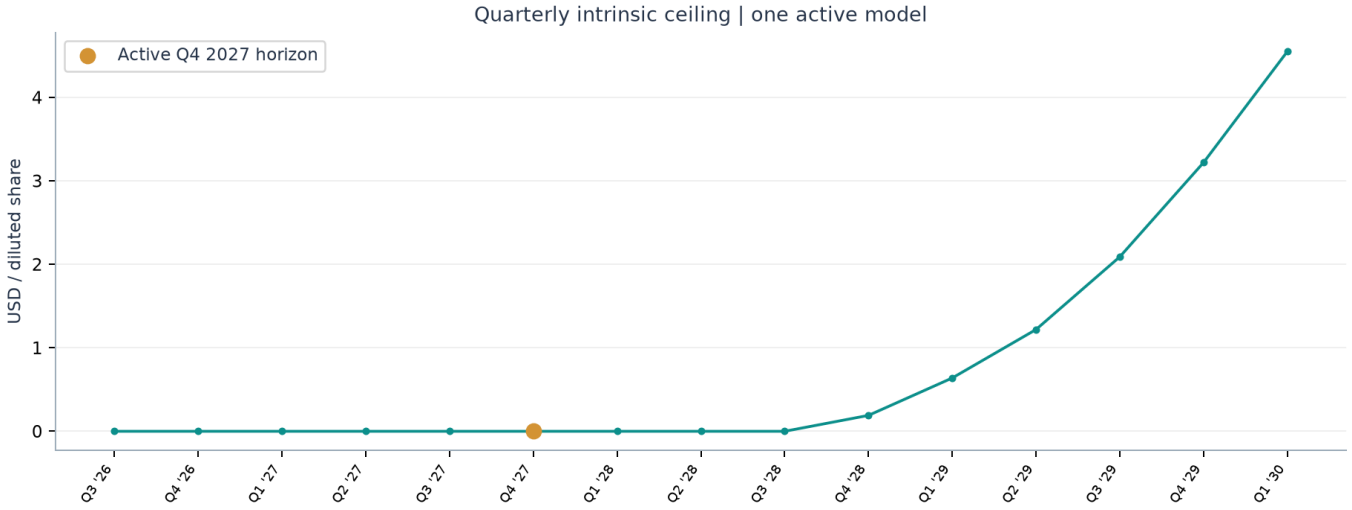

Gross profit, operating expenses and earnings

Operating profit equals gross profit less operating expenses and any separately identified attribution reserve. Figures are forecasts, not reported historical quarterly outcomes.

Quarter	Revenue	GP	Opex	Valuation OP	OP margin
Q3 2026	13.5	5.4	31.2	-25.8	-191.4%

Q4 2030	160.7	84.6	52.9	31.7	19.7%

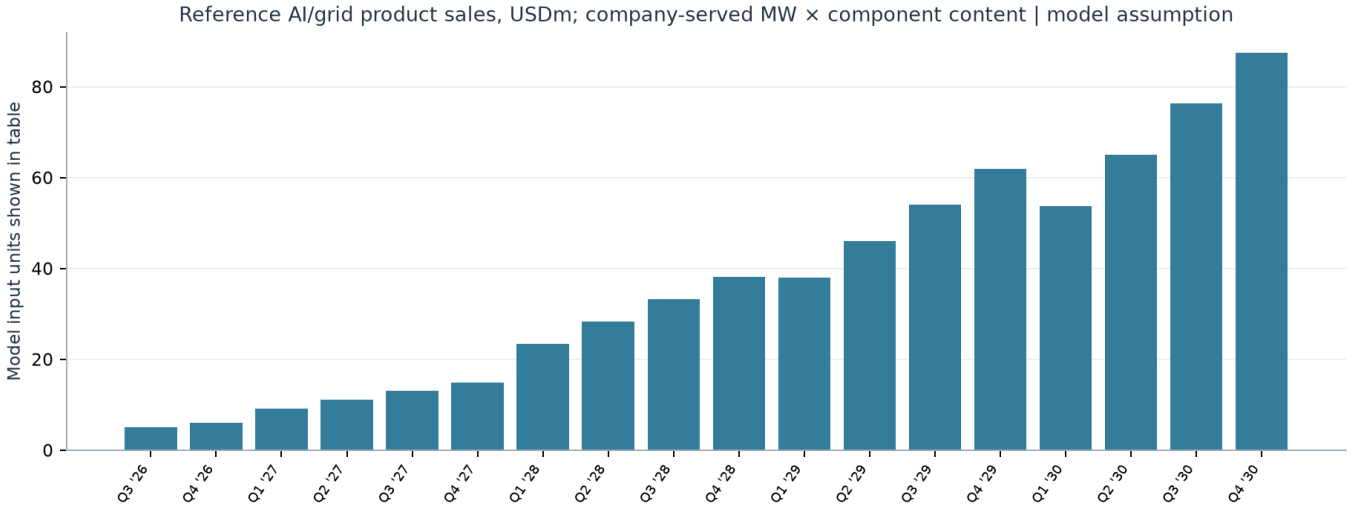

The complete ceiling path

Quarter Q prices Q plus the next three calendar quarters. All fifteen ceilings link to the same operating rows used in the workbook. Outer quarters have lower evidence visibility.

Quarter	Four-quarter earnings window	F4Q OP	Multiple	Shares	Ceiling
Q3 2026	Q3 2026 to Q2 2027	-121.2	20x	286.082	0.00

The operating constraint behind the forecast

The driver series is a stated model assumption, not a disclosed commitment. It must be evaluated with the qualification, customer capture, cost and overlap discussion.

Quarter	Reference AI/grid product sales, USDm; company-served MW x component content	Status
Q3 2026	4.995	Q3 revenue/non-GAAP guide translated to fully expensed model

Quarterly revenue-vector derivation

All rows below are reference inputs. Gross profit = vector revenue x the stated gross margin, except explicitly labeled zero-sales cost credits. The next table applies the separately weighted evidence deltas. A product-level proxy is a model assumption even when the group total is calibrated to guidance.

Quarter	Revenue vector	Revenue	Gross margin	Gross profit
Q3 2026	AI AC/DC and sidecar SiC	2.3	39.7%	0.9
Q3 2026	AI in-tray GaN power devices	1.5	39.7%	0.6

Q4 2030	14.3	9.2	10.2	6.0	1.4	1.2	3.8	0.0

The categories reconcile to reference operating expenses. Incremental costs below are applied once; depreciation or stock compensation already included in a reference category is not added again.

Probability-weighted financial bridge

Active = reference + sum(probability x bounded conditional delta). Negative deltas are retained. A branch with zero near-term increment remains zero only for the timing or overlap reasons documented in the evidence register.

The financial claims shown here are matched to the end of each four-quarter earnings window. Operating-quarter cash and claims schedules elsewhere show balances at their own quarter dates.

Claim decisions, overlap and triggers

NVTS-RAMP

probability: 0.65

source: Q1/Q2 calls; Q2 presentation pp4-6; September 1 GlobalFoundries release; September 8 Citi management discussion.

Conditional bound: Incremental company-served capacity above reference: 2027 SiC 1,000 MW, GaN 500 MW, grid 400 MW; 2028 2,000/1,500/1,000 MW; 2029 3,500/3,000/2,000 MW; 2030 5,000/5,000/3,000 MW. Selected component content $6,500/$12,000/$11,000 per MW. 2028 conditional revenue bound $20-65M, selected $42M. These are analytical sold-product equivalents, not disclosed customer bookings.

bridge: Conditional incremental sales $16.9/$42/$80.75/$125.5M in 2027-2030. GP 55%; variable opex 6% of sales plus $2/$3/$4/$5M annual qualification/support costs. 2028 conditional GP $23.1M, opex $5.52M, OP $17.58M; weighted revenue $27.3M and OP $11.427M. Incremental capex $4M per year and working capital are in each cash outcome.

overlap: Reference already includes accepted capacity and rising mix. Only additional served MW are eligible. GlobalFoundries, TSMC buffer wafers, Magnachip and the architecture roadmap support one qualification/volume event, not four additional demand shocks. JFET is within SiC content, not a separate TAM-to-revenue row.

triggers: Customer qualification, accepted shipments, wafer/package/test yield, repeat sockets, realized product mix and gross margin.

annual Conditional: 2027: revenue: 16.9 2027: gp: 9.295 2027: opex: 3.0140000000000002 2027: op: 6.281 2028: revenue: 42.0 2028: gp: 23.1 2028: opex: 5.5200000000000005 2028: op: 17.580000000000002 2029: revenue: 80.75 2029: gp: 44.4125 2029: opex: 8.845 2029: op: 35.5675 2030: revenue: 125.5 2030: gp: 69.025 2030: opex: 12.53 2030: op: 56.495000000000005

NVTS-IVR

probability: 0.55

source: August 24 acquisition presentation pp3-8; September 8 Citi discussion; September 8 S-4; October 6 closing and CEO letter.

Conditional bound: Commercial revenue begins H2 2028, selected $30M in 2028, $90M in 2029 and $180M in 2030. Illustrative processor equivalents 0.1/0.3/0.6M at $300 of sold regulator content; 2028 bounded 0.05-0.2M at $200-400 gives $10-80M. Neither wallet nor processor volume is quoted by a customer. The selected $300 can be represented by 50 cells at $6, an engineering-economic proxy, not an announced ASP.

bridge: Conditional GM 55/60/62%; variable opex 15% of IVR revenue. Fixed acquired engineering $12/16/20/24M in 2027-30, assumed-option/ordinary SBC $4/4.5/5/5.5M and $15M annual purchased-intangible amortization remain in the reference even if commercialization fails. Milestone employee compensation $28.9M is expensed over eight quarters Q4 2026-Q3 2028 in the successful event. 2028 conditional incremental OP $16.5-$4.5-$10.8375=$1.1625M; weighted $0.639375M. 2029 conditional OP $40.5M, weighted $22.275M. Successful outcomes reserve 1.289869M merger earnout shares plus 28.9/12.97=2.228219M employee shares; no purchase-price cash is charged twice.

overlap: Claros adds the final processor stage rather than another count of the upstream 800V power wallet. The $3.5B issuer IVR SAM is not multiplied by an assumed share. VPD and EPD are alternative implementations of the same sold content, not two independent revenues. No leading xPU or NVIDIA order is inferred.

triggers: Customer design qualification, 2028 program timing, performance compensation conditions, production yield, purchased-intangible allocation and actual acquisition closing adjustments.

annual Conditional: 2027: revenue: 0 2027: gp: 0 2027: opex: 14.45 2027: op: -14.45 2028: revenue: 30 2028: gp: 16.5 2028: opex: 15.337499999999999 2028: op: 1.1625000000000014 2029: revenue: 90 2029: gp: 54.0 2029: opex: 13.5 2029: op: 40.5 2030: revenue: 180 2030: gp: 111.6 2030: opex: 27.0 2030: op: 84.6

NVTS-PRICE

probability: 0.35

source: Q1 management reliability/execution discussion and Q2 emphasis on adoption rather than blanket price increases; qualified supply creates a bounded new-order opportunity.

Conditional bound: Only 50% of reference AI/grid revenue is assumed repriceable; selected 3% premium, bounded 2-5%, beginning 2027. No premium on reference PC/industrial, incremental ramp MW, or IVR.

bridge: Premium revenue = eligible reference sales x50%x3%. GP 70% of premium after 30% incremental manufacturing/test/expedite cost; support opex 2%. 2028 eligible $123M gives $1.845M conditional revenue and $1.2546M OP; weighted $0.64575M revenue and $0.43911M OP. This is a modest Rule 16b scenario, not an announced price increase.

overlap: Product mix and utilization are already in reference gross margins. Premium affects only the nominated reference repriceable pool. Capacity availability does not prove stronger pricing at every customer.

triggers: New qualified orders, renewal terms, customer cost of delay, realized ASP after product mix and packaging cost.

annual Conditional: 2027: revenue: 0.7245 2027: gp: 0.50715 2027: opex: 0.014490000000000001 2027: op: 0.49266 2028: revenue: 1.845 2028: gp: 1.2914999999999999 2028: opex: 0.0369 2028: op: 1.2546 2029: revenue: 3.0 2029: gp: 2.0999999999999996 2029: opex: 0.06 2029: op: 2.0399999999999996 2030: revenue: 4.2375 2030: gp: 2.96625 2030: opex: 0.08475 2030: op: 2.8815

NVTS-RISK

probability: 0.25

source: 2025 annual risk factors; Q2 10-Q distributor concentration and Wolfspeed/Renesas litigation; foundry qualification still in progress.

Conditional bound: Combined adverse execution/competition/legal scenario: 15% loss of reference AI/grid sales, bounded 5-25%, plus 3 percentage points lower GP on the same eligible reference sales, bounded 1-5 points. Incremental recurring legal cost $3M annually and a $20M settlement proxy paid Q4 2028, bounded $10-40M. This is not an estimate of the actual damages or litigation outcome.

bridge: Remove associated reference product GP plus 3% of eligible sales; save 6% of lost sales in variable support expense, then add $3M legal cost. 2028 conditional sales -$18.45M, GP -$12.5115M, net opex +$1.893M, OP -$14.4045M; weighted OP -$3.601125M. Before payment the hypothetical settlement is an end-window claim; after Q4 2028 the claim is zero and the cash payment remains in the funding bridge.

overlap: This is one combined adverse outcome, not repeated charges for every risk headline. Operating positives can coexist with this downside, producing partial success. No damages, injunction or liability is presented as established.

triggers: Court rulings, settled amounts, redesign costs, customer concentration, foundry yields and qualification delays.

annual Conditional: 2027: revenue: -7.245 2027: gp: -4.6536 2027: opex: 2.5652999999999997 2027: op: -7.2189 2028: revenue: -18.45 2028: gp: -12.5115 2028: opex: 1.8930000000000002 2028: op: -14.4045 2029: revenue: -30.0 2029: gp: -21.1425 2029: opex: 1.2000000000000002 2029: op: -22.342499999999998 2030: revenue: -42.375 2030: gp: -30.5865 2030: opex: 0.4575000000000001 2030: op: -31.044

NVTS-IA32

probability: 0.65

source: April 21 Irrational Analysis article, all saved body text; prior complete 47-image review and primary datasheet correction ledger retained.

Conditional bound: Device integration and constrained board space support the same qualified-volume branch above. Source league tables do not supply a new order or accepted-MW quantity.

bridge: 100% overlap with NVTS-RAMP; zero additional revenue/OP beyond its $42M conditional 2028 revenue and $17.58M OP. The credibility of the technical mechanism supports a nonzero 65% branch, rather than an independent additive uplift.

overlap: 650V continuous is not 800V continuous blocking; SOA pulse width is not switching frequency; heat dissipation is not useful output power; external driver supply and gate threshold differ. TI and Infineon offer integrated alternatives. No monopoly or universal best-device claim is retained.

triggers: Matched converter efficiency, thermal/EMI/reliability tests and commercial qualified socket economics.

NVTS-ENPH-SST

probability: 0.65

source: Enphase May 2026 whitepaper mentions commercially available 650V bidirectional devices; current Navitas 800V architecture sources.

Conditional bound: No separately allocated 900V Enphase socket or supplier contract. Existing grid/AI served-MW scenarios already cover device opportunities in candidate architectures.

bridge: Zero separate increment after 100% overlap with the same grid/qualified-device pool; a generic component mention does not establish the customer-specific quantity or paid wallet. Revisit when a distinct delivered socket/cost bridge changes the pool.

overlap: No Enphase full-system revenue assigned to its potential semiconductor supplier; no 650V availability relabeled as a 900V awarded BOM.

triggers: A named supplier design, voltage/topology match, supplier content and accepted customer shipments.

Remaining bounded uncertainties

- The June cash balance is filed; the October post-acquisition cash balance is not. $126.4M closing cash is the S-4 estimate, subject to working-capital, debt and fee adjustments. The cash bridge is a model, not a reported October balance.

- Claros standalone revenue, expenses, purchased-intangible allocation, useful lives and exact acquired cash are not disclosed in the reviewed documents. Annual fixed costs and $90M intangible basis over six years are explicit proxies; the $7.5-24M annual amortization sensitivity is retained.

- Reference product revenues and gross margins are analytical allocations within one reported segment. Served MW measure sold component equivalents at a nominated stage; they are not all energized customer capacity or announced orders.

- Design wins and sales pipeline are not committed backlog. First GlobalFoundries wafers, internal samples, customer samples, completed reliability qualification and good-unit volume are different milestones.

- March TAM content ranges and September management content discussion differ by stage and JFET scope. The selected $6.5k/$10k/$11k reference wallets are explicit proxies within source ranges, not inferred invoices. No redundancy multiplier or whole-TAM revenue is added.

- Q3 non-GAAP gross margin is translated using separately expensed SBC and purchased-intangible amortization. The non-SBC expense forecast includes ordinary depreciation; it is added back once only in cash flow. Core recurring legal/other costs are not silently removed with the non-GAAP reconciliation.

- The 269.062970M S-8 planning base combines dated common shares and estimated merger closing shares. Subtracting 6.912729M gives 262.150241M September 28 common, a derived reconciliation rather than a directly printed exact count. Confirm adjusted shares after closing.

- The 35M S-8 equity-plan registration is not issued common stock. The 2.395762M assumed Claros options and milestone compensation are separate economic reserves; option exercise cash is deliberately zero. The future path does not add existing awards again when they vest. However, exact June-to-September award settlements are not disclosed; retaining the full June reserve against the later legal base may conservatively overreserve up to the 1.069853M legal-share increase over June. This is an explicit reconciliation gap, not an exact outstanding-award count.

- A $5M Magnachip equity investment is modeled as a reserved cash outflow; the September filing corrects its expected closing date, but reviewed sources do not independently confirm completed settlement. It does not issue Navitas shares and receives no valuation asset bonus.

- Wolfspeed and Renesas litigation is unresolved. The 25% combined adverse state and $20M payment are bounded analytical stresses, not estimated damages, a booked liability, or evidence of wrongdoing.

- All 16 operating outcomes remain funded in the stated model, with at least $153.8M cash. This does not establish unlimited liquidity: acquired liabilities, fees, redesign costs and foundry prepayments could be larger. No restricted cash, outstanding ATM capacity, inventory or purchase deposits are treated as free cash.

- The independent event structure is an approximation. GaN qualification and IVR success could be correlated; both share the same funding resources. Joint no-success and joint-success states are shown explicitly and probability sensitivities preserve the shared event/share/claim links.

- The Q1 release PDF failed retrieval. Q1 10-Q and the full Q1 management call provide actuals and discussion; Q2 release/deck/10-Q, Citi transcript, annual, S-4 and closing/S-8 originals were archived.

- Nil under the current 20x fully expensed operating-profit method does not mean the company has no technology, cash, liquidation value or market option value. Cash is not added and no revenue multiple is substituted to produce a positive target.

Sources and basis

The current production framework was read before initiation. Source statements are evidence, not instructions. The shared model data drives both this PDF and the linked Excel model; the clean-state editable artifact embeds these same images.
