OUST - Ouster | Full investment artifact

Full active edition | Financial methods and portfolio Base overrides preserved.

Research date: 3 October 2026 | **Framework:** 8.0 consolidated | **Format:** standalone current-state analysis
Status: Full Framework 8.0 quarterly model, refund-normalized economics | **Classification:** PHYSICAL-AI PERCEPTION PLATFORM - differentiated, competitive
Artifact Base: 43/60 = **72% - Watchlist** | **Protected portfolio Base:** 78% (user override retained; separate from artifact assessment)
Snapshot: supplied-workbook price USD 43.400; model share proxy 72.200000M; implied snapshot market capitalization 3,133.480 USD millions. Price is frozen from the supplied workbook, not a current-market refresh; capitalization uses the modeled denominator.
Active ceiling: Q4 2027 **USD -12.407991426822 (neg)**, pricing Q4 2027-Q3 2028. All 15 quarterly ceilings are derived below. The sanctioned earnings method does not support a positive ceiling in this window; this is not a negative stock-price forecast.

The model combines a broad physical-AI adoption path with a loss-to-profit transition. The latest reported gross-margin improvement includes a temporary duty refund. Seneca's drone selection supports the modeled Rev8 expansion, while its bounded commercial contribution overlaps the existing standalone-lidar forecast. The financial anchor remains the August 2026 Q2 release and guidance; the October 1 Seneca announcement is an operating update, not new earnings.

1. Supercycle, supply chain and durable advantage

Physical automation expands the market for reliable perception across industry, infrastructure, robots and vehicles. Ouster combines digital lidar with cameras and deployment software. Customers can choose competing sensors or different architectures, so differentiation and integration do not imply a sole-source bottleneck.

Perception requirements → qualified sensors, cameras and complete site solutions → shipped units/site deployments → differentiated margins → R&D, selling and support → shareholder earnings. Industrial machine spending is not wholly available to the sensor vendor.

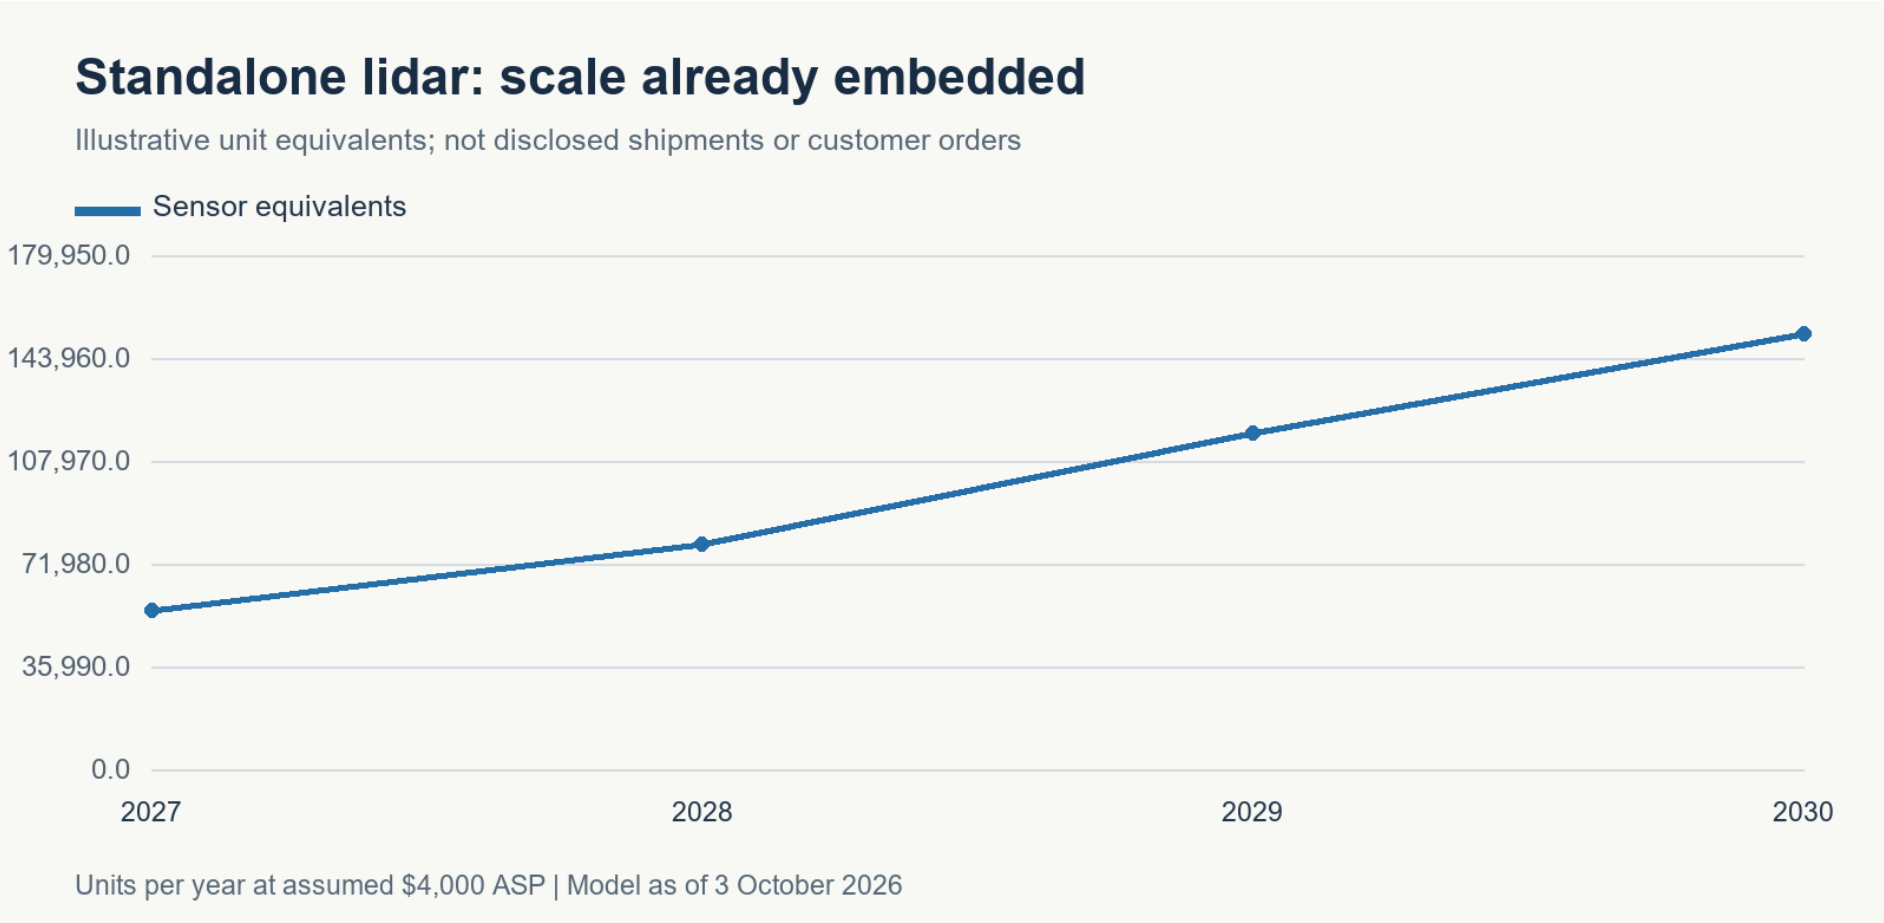

Business / curve	Stage	Evidence and next inflection
Rev8 lidar	Production ramp	Customer transitions and capacity utilization matter.
Stereolabs cameras	Expansion	Lower price per unit but higher camera counts per machine.
BlueCity / Gemini	Scaled deployments from a small base	Installed sites support expansion, with project timing risk.

Stage percentages are qualitative framework bands relative to a possible mature opportunity, not measured market penetration. A current capacity constraint can coexist with a larger long-term TAM; qualification and economic capture decide how much reaches this company.

2. Forward TAM and the three-phase expansion lens

Phase	Engineering opportunity	Demand-to-company bridge
2026-27	Industrial and infrastructure adoption	Q3 starts at56M guidance midpoint;2027 revenue336.5M follows qualified customer and camera growth.
2028-29	More physical AI systems	Model2028 revenue518M and2029 revenue815M; implied annual growth exceeds40%, conditional on repeated deployment wins.
2030+	Larger hardware and solution reach	Lidar610M at assumed4000USD per standalone sensor implies152500 units/year, above initial100000+ capacity. Camera/compute211M at1000USD equivalent implies211000 units. Solutions312M could comprise6000 new/expanded sites×40000USD plus12000 installed sites×6000USD annual service; these are explicit modeling units, not reported contracts or prices.

The 100% / 50% / 20% thematic weights guide thesis assessment. They are not blanket discounts to reported sales, contracts or all forecasts. Programme probabilities below govern only separately identified optionality. Current reported sales calibrate the starting point; they do not cap the future market.

Standalone lidar: scale already embedded. Units per year at assumed $4,000 ASP. Illustrative unit equivalents; not disclosed shipments or customer orders

Calendar year	Lidar revenue USD M	Assumed ASP USD	Implied sensor equivalents
2027	222.000	4,000	55,500
2028	316.000	4,000	79,000
2029	470.000	4,000	117,500
2030	610.000	4,000	152,500

The unit bridge excludes lidar bundled inside integrated solutions. Volume, qualification and production capacity must support this path; a design selection is evidence about conversion, not a second pool to add on top.

3. Current earnings and management evidence

Q2 revenue54.626M comprises52.763M product and1.863M royalty/other. GP26.685M less46.730M operating expenses givesGAAP OP-20.045M [E1]. Removing the5.4M import-duty refund gives normalized GP21.285M and OP-25.445M [E2]. The stronger reported margin therefore does not establish a49% recurring margin.

May5 and August6 full published management discussions and Q&As were reviewed [E3/E4]. Rev8 production scales inH2, with customer conversion over roughly two years. Management maintains a35-40% near-term gross-margin framework, while solutions may improve the blend. The profitability discussion is distinct from immediate GAAP profitability.

Both latest full management transcripts were reviewed. No audited standalone lidar/camera/software segment margin or multi-year contracted revenue bridge is published. Third-party transcript copies contain transcription errors, so financial figures use issuer filings.

Seneca Argo-1: commercial application inside Rev8

Issuer evidence - 1 October 2026. Ouster and Seneca announced integration of Rev8 OS1 Max lidar into Seneca's autonomous drone platform. The issuer identifies the sensor on the Argo-1 mast and describes cargo transport, terrain mapping and utility/infrastructure inspection applications. Selection factors include rugged operation, responsive engineering support and the product roadmap. The announcement provides no paid unit count, realized ASP, contract value, exclusivity or shipment schedule. [E6]

ASTRA model judgment: assign a **75% probability** to continued commercial drone deployments during **2027-2028**. The named customer and disclosed integration support this judgment; wildfire operating requirements, fleet adoption and support economics remain execution risks. This is an outcome probability, not the probability that the announcement exists.

The retained $4,000 modeled ASP supports an illustrative annual envelope of **50-250 sensor equivalents = $0.2-$1.0 million**. This bounds possible capture; it is **not an order forecast** or a disclosed Seneca fleet. Standalone-lidar revenue already reaches **$222 million in 2027** and **$316 million in 2028**, incorporating customer transitions and cross-application Rev8 adoption. The Seneca envelope is assigned **100% overlap** with that forecast. Accordingly, its separate active revenue and operating-profit increments are **$0**, with no additional score point. This zero reflects existing economic coverage, not a requirement to wait for official confirmation.

At the retained **35-40% lidar gross-margin range**, the illustrative $0.2-$1.0 million sales envelope would produce **$0.070-$0.400 million gross profit before engineering/support**, if isolated. Incremental development and customer support would consume part of that amount. There is no automatic Opex-ratio expansion, scarcity premium or sole-source assumption. Section 12 shows the complete overlap calculation and revision tests.

4. Local evidence and calibration packet

Revenue calibration error is0% against reported totals. Historical normalization removes5.4M once. Product allocation and margins reproduce normalized GP; they are not issuer segment disclosures. There is no credible cloud-capex mapping for this industrial business. Wider product applicability expands the engineering opportunity without treating all robots as Ouster customers.

5. Summing thesis score

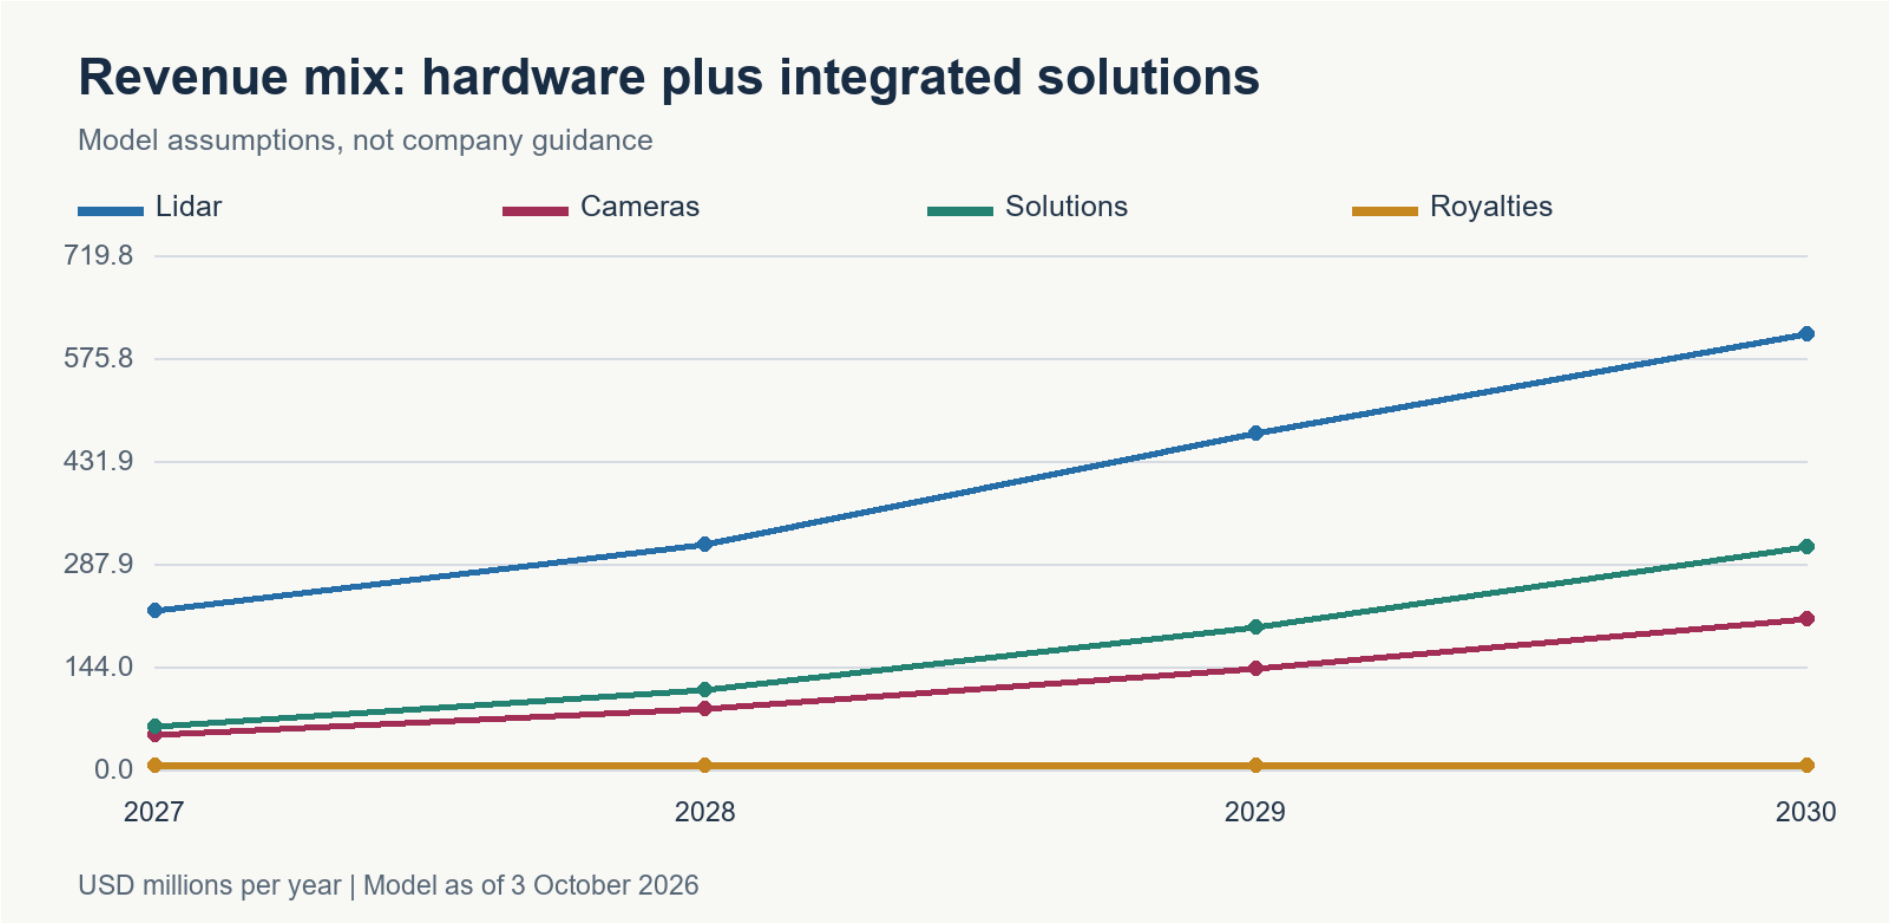

Category	Points / maximum	Evidence
Core thesis	16/20	Broad differentiated sensing platform.
Inflection / cycle	8/10	Rev8 and cameras grow; normalized losses persist.
Forward TAM	9/10	More applications and wider traffic coverage.
Catalysts	4/5	Production and customer deployment milestones.
Macro / policy	8/10	Automation and infrastructure demand.
Alpha / evidence	3/5	Refund normalization and mix discipline improve the assessment.
Risk deductions	-5	Five independent risk classes.

Sum: 43/60 × 100 = 71.666667%, conventionally rounded to 72%. This advisory thesis score does not replace any portfolio Base override. The separate risk classes below total the displayed deduction; holding status and classification do not waive that deduction.

6. Revenue sources, capture and product margins

Two reported revenue lines calibrate the total. The product subdivision is explicitly an analyst allocation: standalone lidar38M, cameras6.85M and integrated solutions7.913M. Solutions include their bundled hardware, which is excluded from standalone lidar. Assigning38% camera GM,55% solutions GM and100% royalty contribution requires32.8075% standalone lidar GM to reproduce normalizedQ2 GP; adding the5.4M refund reproduces reported GP. These subsegment margins are not disclosed actuals.

Vector	Actual calibration / source	Forward demand and capture	Margin derivation / constraint
Standalone lidar	38M allocated within52.763M product	2030 annual610M; about152500 units at modeled4000USD	35→40% GM; capacity must expand beyond initial plan.
Cameras / compute	6.85M allocated	2030 annual211M; lower ASP and more units	38→42% GM; manufacturing investment required.
Integrated solutions	7.913M allocated	2030 annual312M site/renewal bridge	55→62% blended GM, including hardware and support; not70% pure software.
Royalty / other	1.863M actualQ2	2026 total5M includingQ1/Q2 actual; then5M annually	100% contribution proxy before group costs.

Revenue mix: hardware plus integrated solutions. USD millions per year. Model assumptions, not company guidance

Year	Lidar	Cameras	Solutions	Royalties	Total
2027	222.000	49.500	60.000	5.000	336.500
2028	316.000	86.000	111.000	5.000	518.000
2029	470.000	141.000	199.000	5.000	815.000
2030	610.000	211.000	312.000	5.000	1138.000

Units: USD millions. Solutions include bundled hardware; its sensors are not repeated in standalone lidar. Product allocations and forward margins are model assumptions, not disclosed segment guidance.

Confidence: reported historical totals are HIGH. Source-based forward extrapolations are MEDIUM only where the cited source sizes the relevant period; other product allocations, future capture and margin assumptions are LOW. A source for the historical anchor does not make an unsourced future factor management guidance. The detailed factors below are the single modeled base case, with uncertain assumptions exposed for review.

V1. Standalone digital lidar hardware

Sources: E1/E2/E3; allocated product anchor and analyst unit path. Revenue = anchor × factor; GP/contribution = revenue × displayed product margin. Forecast confidence: LOW unless a specific actual/guided total is identified above.

Quarter	Revenue anchor	Demand / conversion factor	Revenue	Product margin	GP / contribution

Q4 2030	Model	311.250	146.250	26.667%	83.000	20.321%	63.250	Mature platform mix	LOW model

OP = sum of product GP/contribution - explicit operating costs. OP margin = OP ÷ revenue. Displayed numbers are rounded for reading; the workbook calculates from unrounded inputs. Guidance assigned to a future quarter retains Model status because guidance is not an actual result.

8. Multiple, shares and recognition convention

Retain20× operating profit. Negative calculated ceilings identify periods where this earnings method cannot support positive value; they are not negative market-price predictions or a substitute for cash valuation.

June issued68.489797M plusJuly3.621876M new shares=72.111673M before subsequent awards. Start72.2M and allow growth to88M. The543281-share overallotment option expired unexercised and is not added. July financing proceeds are cash funding, not revenue or profit.

The valuation denominator is the ceiling quarter’s diluted-share proxy. It is not a historical EPS weighted-average assumption disguised as a fully known future capitalization. Unit factor: 1; this converts the model units to USD per share. No cash balance, enterprise-value adjustment or after-tax earnings substitution is added to the operating-profit ceiling.

9. Complete rolling four-quarter ceiling derivation

Rolling forward-four-quarter earnings ceiling. USD per diluted share. 20x GAAP-style operating profit; negative outputs are not market-price predictions

Ceiling quarter	Exact earnings window	Forward 4Q OP	Multiple	Diluted shares M	Ceiling USD	Key inflection
Q3 2026	Q3 2026 → Q2 2027	-89.764603	20×	72.200000	-24.865541 (neg)	Q3 revenue guide midpoint

- **Q2 2029:** (14.174706 + 23.102941 + 32.977059 + 40.423529) × 20 × 1 ÷ 82.423529 = **26.855981 USD/share**. Window: Q2 2029-Q1 2030.
- **Q3 2029:** (23.102941 + 32.977059 + 40.423529 + 47.638235) × 20 × 1 ÷ 83.352941 = **34.585886 USD/share**. Window: Q3 2029-Q2 2030.
- **Q4 2029:** (32.977059 + 40.423529 + 47.638235 + 55.384706) × 20 × 1 ÷ 84.282353 = **41.864880 USD/share**. Window: Q4 2029-Q3 2030.
- **Q1 2030:** (40.423529 + 47.638235 + 55.384706 + 63.250000) × 20 × 1 ÷ 85.211765 = **48.513599 USD/share**. Window: Q1 2030-Q4 2030.

10. Annual trajectory cross-check

Calendar year	Revenue	GP / contribution	Opex	OP	OP margin
2027	336.500	138.202	217.647	-79.445	-23.609%
2028	518.000	221.496	251.529	-30.034	-5.798%
2029	815.000	362.031	285.412	76.619	9.401%
2030	1,138.000	525.991	319.294	206.696	18.163%

These are calendar-year sums of the quarterly path, not extra revenue and not the live valuation method. For non-December fiscal reporters, fiscal guidance and these calendar totals must be aligned using the period mapping above; a four-quarter run rate is not automatically the same fiscal year. Outer-year outputs are conditional TAM/capture trajectories, not verified management sales targets.

The 2030 sum is 610 + 211 + 312 + 5 = 1,138M. The quarterly cadence reflects mixed hardware and solution economics across a market broader than standalone lidar. Production beyond the initial 100,000-sensor capacity and large site expansion remain explicit requirements, not assumed current capabilities.

11. Dilution sensitivity - same operating case

Denominator sensitivity	Q4 2027 shares M	Q4 2027 ceiling USD	Change in signed output USD
-5% shares	73.004706	-13.061044 (neg)	-0.653052
+0% shares	76.847059	-12.407991 (neg)	+0.000000
+5% shares	80.689412	-11.817135 (neg)	+0.590857
+10% shares	84.531765	-11.279992 (neg)	+1.127999

This isolates the starting-quarter share denominator with the same Q4 2027-Q3 2028 operating window. Because that window is loss-making, fewer shares make the signed result more negative; this mechanical sensitivity does not make dilution economically desirable. The base case remains the explicit quarterly share path. No share schedule is changed.

12. Programme and probability ledger

Programme / signal	Source and probability	Amount / unit base	Treatment in this model	Escalation / recognition
Utah expansion	E5;95% disclosed award	160 new intersections; exact Ouster revenue undisclosed	Included within solution growth, no extra duplicated contract total	Track deployment and revenue
Rev8 customer orders	E3;commercial orders confirmed	Selected million-dollar-plus orders, no full backlog	Included in product forecast	Reconcile production shipments
NVIDIA ecosystem qualification	E3/E4; technical integration	No committed purchase amount	Adoption support overlaps existing customer-capture path; no separate NVIDIA sales pool	Test customer usage, paid volumes, product scope and incremental capture
Future site capture	Analyst;LOW confidence	2030 illustrative unit bridge	Single modeled base case	Replace unit economics with disclosures

Probabilities are analyst judgments under the framework signal hierarchy. Embedded revenue is not multiplied or added a second time. Incomplete disclosures call for a bounded, labeled proxy and an overlap test. Missing official confirmation alone does not exclude a credible opportunity. Incremental TAM, capture or timing evidence changes the corresponding operating input; existing modeled growth is not counted again.

Seneca: probability-weighted overlap bridge

Ledger field	Seneca treatment
Signal and source	OUST-SENECA-DESIGNWIN-20261001; Ouster issuer release E6. One source/event, including reposts.
Defined outcome / timing	Continued commercial drone deployments during 2027-2028.
Probability and rationale	75% subjective ASTRA judgment: named customer/integration supports deployment; fleet adoption and operating demands remain uncertain.
Reference already modeled	Standalone lidar: 2027 $222M; 2028 $316M. Rev8 customer transitions across applications are already embedded.
Conditional annual envelope	50-250 sensor equivalents x existing assumed $4,000 = $0.2-$1.0M; illustrative capture envelope, not orders.
Raw probability-weighted envelope	75% x $0.2-$1.0M = $0.150-$0.750M per year before overlap; diagnostic only.
Overlap / dependence	100% overlap with existing generic Rev8 growth; not an independent new revenue vertical.
Active annual revenue increment	75% x ($0.2-$1.0M) x (1 - 100%) = $0.000M.
Profit and cost bridge	35-40% lidar GM implies conditional gross profit $0.070-$0.400M before engineering/support. Zero incremental gross profit after overlap; no automatic operating leverage.
Quarterly model reconciliation	OUST_Q_Model E42:E49 lidar revenues and D19:F26/N19:N26 group economics unchanged; active added revenue/OP in each 2027-2028 quarter = $0.000M.
Ceiling and Base reconciliation	Q4 2027 USD -12.407991426822; 20x forward OP. Analytical Base72; protected Excel Base78. No numerical change.
Upgrade / reduction tests	Paid unit volumes, repeat fleet orders, customer concentration and support costs can alter the 100% overlap estimate. A timing miss, substitution or weaker unit economics lowers the outcome weight.

A 50%, 75% or 95% outcome probability produces the same separate $0 active increment while overlap remains 100%. Revisit overlap when commercial evidence supports a deliverable pool beyond the saved generic growth; do not increase probability merely to force a higher ceiling.

13. Scored risk classes

Risk class	Scored deduction	Mechanism and consequence
Sensor competition and substitution	-1	Other lidar, radar and cameras can win.
Adoption timing	-1	Pilots and orders do not assure rapid scaled deployment.
Margin and manufacturing	-1	Pricing and production costs may limit gains.
Software and integration	-1	Bundled solutions are not pure recurring SaaS.
Losses and dilution	-1	Compensation and further strategic spending can erode per-share capture.

14. Dated catalysts, counters and escalation

1. **Q3/Q4 2026 - Rev8 volume:** Measure shipments, normalized gross margin and conversion to revenue.
2. **2027 profitability monitoring - Cash versus GAAP:** Reconcile adjusted EBITDA with stock compensation and GAAP operating profit; the current model remains loss-making in 2027.
3. **2028-2030 - Capacity and sites:** Track funding, installed capacity and repeat customer purchasing against the existing unit path.
4. **2027-2028 - Drone conversion:** Check Seneca paid units, repeat fleet orders, revenue concentration and engineering/support expense. Revise probability, timing and overlap when these change the defined economic outcome.

15. Cross-book monitoring

Benchmark and Fabrinet can benefit from actual outsourced production. NVIDIA ecosystem support can ease adoption without creating a guaranteed customer order. Ouster and Planet both serve physical-world data demand but their revenue drivers and capital needs differ.

16. Source register and model limits

E1 - Ouster Q2 results (2026-08-06). Financial statements andQ3 revenue guidance54.5-57.5M.

E2 - Ouster Q2 Form10-Q (2026-08-07). Duty refund, share count and July offering.

E3 - Q2 management earnings transcript (2026-08-06). Management remarks and Q&A; publication date differs from call date.

E4 - Q1 management earnings transcript (2026-05-05). Complete published discussion; automated transcription spellings checked against issuer materials.

E5 - Utah BlueCity expansion (2026-08-11). 160 additional intersections and nearly300 total contracted in Utah.

E6 - Ouster / Seneca partnership (2026-10-01). Primary issuer release, read October 3. Named Rev8 OS1 Max integration; commercial quantities and economics undisclosed. The 75% deployment probability, $4,000 ASP envelope and 100% overlap treatment are explicit ASTRA model judgments, not issuer guidance.

Product subsegments, realized ASPs and separate recurring software revenue are undisclosed. Forward unit and site economics are analyst estimates. The model is not an independent estimate of the entire robotics market.
