SHAZ - SharonAI Holdings | Full investment artifact

Full active edition | Financial methods and portfolio Base overrides preserved.

Research date: 17 September 2026 | **Financing evidence updated:** 2 October 2026 | **Framework:** 8.0 evidence update; original operating model retained | **Format:** standalone current-state analysis **Status:** NOT HELD (last supplied artifact; no trade-state refresh) | **Classification:** ⚡ TEMPORAL: sovereign GPU deployment and contracted-capacity window, with platform switching costs **Artifact Base:** 44/60 = **73% - Watchlist** | **Protected portfolio Base:** 80% (user override retained; separate from artifact assessment) **Snapshot:** supplied-workbook price USD 49.790; model share proxy 60.000000M; implied snapshot market capitalization 2,987.400 USD millions. Price is frozen from the supplied workbook, not a current-market refresh; capitalization uses the modeled denominator. **Active ceiling:** Q4 2027 **USD 187.668699**, pricing Q4 2027-Q3 2028. All 15 quarterly ceilings are derived below. The headline follows the current master horizon; the underlying quarterly path is unchanged.

Working, powered GPU capacity is a scarce delivered product. SharonAI has a much larger signed book, NVIDIA-supported revenue floor and secured expansion space, while partner-led deployment reduces the need to own every infrastructure layer. The opportunity extends into premium resale and additional customer capacity. Execution, capital structure and asset life still govern what those contracts earn for common shareholders.

1. Supercycle, supply chain and durable advantage

SharonAI supplies usable sovereign compute, combining leased datacenter capacity, accelerators, networking and service delivery. Customer acceptance and enforceable contracts strengthen its position relative to an uncontracted capacity plan. Its bottleneck is delivery of working clusters with sustainable unit economics. The five-year service commitments create revenue visibility only after deployments start; GPU procurement and datacenter capacity are inputs, not additional revenue vectors.

AI-native, hyperscaler, enterprise and government workloads → reserved compute/storage services → powered Tier 3/4 facilities, GPU/network/storage clusters and orchestration → NVIDIA, OEM/WWT delivery, VAST and colocation partners. SharonAI integrates and operates the usable service. Power availability, procurement access, residency requirements, trained operations and multi-month deployment create a temporal bottleneck. Data gravity and revalidation add switching costs. The architecture can use other neoclouds, so the company is not classified as a permanent technology monopoly. DB4 AI infrastructure and the deployed-compute framework primitive apply; DB10 agentic workloads and storage intensity expand demand.

Business / curve	Stage	Evidence and next inflection
Current contracted clusters	Pre-ramp 0-10% of contracted annual revenue	Q2 legacy revenue is small; Q4 2026 launches and H1 2027 deployment drive the transition.
40,000-GPU AICP programme	Pre-ramp into ramp 10-50% duringH1 2027	Management targets full billing by Q3 2027; the model places this actual inflection in the relevant windows.
92 MW additional capacity	Pre-ramp 0-10%	Secured physical capacity differs from signed customer contracts; conversion is probability-weighted.

Business / curve	Stage	Evidence and next inflection
Premium/storage and next generation	Early adjacent curve	Resale above the NVIDIA minimum and storage demand are evidenced; specific Vera Rubin pricing and new capacity beyond 212 MW are not yet guided.

Stage percentages are qualitative framework bands relative to a possible mature opportunity, not measured market penetration. A current capacity constraint can coexist with a larger long-term TAM; qualification and economic capture decide how much reaches this company.

2. Forward TAM and the three-phase expansion lens

Phase	Engineering opportunity	Demand-to-company bridge
Phase 1 - current services;100% thematic	Training, inference and high-performance storage in Australia/New Zealand	USD 8.793 bn commitments across 5/6-year terms imply USD 1,595.267M annual contracted run rate at full service, before legacy business. This is not current annual revenue. Contracted 120 MW is part of secured 212 MW.
Phase 2 - expansion;50% thematic	Additional 92 MW, higher-value customer resale and storage-intensive AI applications	Source benchmark USD 15M/MW-year gives USD 1.38 bn annual potential for 92 MW before probability. Existing AICP40,000GPUs at USD 4/hour imply USD 1.4016 bn gross annual billing; only the amount above the already modeled minimum can add incremental retained economics.
Phase 3 - new workloads;20% thematic	Vera Rubin-era workloads, broader sovereign/regulated use and repeat customer expansion	Management describes late 2027/28 customer discussions. No further datacenter megawatts, renewal windfall or stand-alone storage TAM is invented. Storage is part of contract economics unless an incremental upsell is priced separately.

The 100% / 50% / 20% thematic weights guide thesis assessment. They are not blanket discounts to reported sales, contracts or all forecasts. Programme probabilities below govern only separately identified optionality. Current reported sales calibrate the starting point; they do not cap the future market.

3. Current earnings and management evidence

Q2 2026 actual revenue USD 1.931381M, gross profit 1.169626M and operating loss 24.784178M. Net loss includes large non-operating remeasurements and must not be substituted for OP. The historical business is too small to validate the new contract ramp. The model separates the existing quarterly revenue anchor from future contracts; calibration to the legacy business does not validate acceptance timing or mature margins.

The complete Q1 May 15 and Q2 August 6,2026 earnings-call transcripts, including all management answers, were read via Quartr’s public Stock Analysis rendering. Analyst questions were used for context, not as management assertions. The Q2 discussion clarifies the NVIDIA minimum-revenue floor, incremental upside sharing, Q3 2027 full billing target for the 40,000-GPU cluster,92 MW uncontracted capacity and deployment/financing dependencies.

Both latest full earnings-call transcripts and management Q&A are covered. Contract values, guarantees and announced capacity are source-based. Exact partner premium split, complete contract cost budgets, final acceptance calendars and the current warrant register remain unresolved. The September 28 facility now discloses part of the funding terms; actual utilization, redacted rate-step dates and funding beyond that facility remain unresolved. Their assumptions and sensitivities are visible, so the full artifact can be reviewed without presenting those gaps as facts.

3A. September 28 financing agreement, disclosed October 1

The signed senior secured facility commits **up to USD 356M**, split between **Facility A USD 150M** and **Facility B USD 206M**, for two indirect wholly owned Australian borrowers. It finances or refinances GPU/server, network, storage and related deployment costs, debt-service reserves and transaction costs supporting a customer compute contract. Utilization is conditional, and the reviewed disclosure does not establish amounts or dates actually drawn. The commitment is therefore neither a new cash balance nor incremental operating revenue. [SHAZ-8]

Facility term	Disclosed fact	Financing implication
Facility A interest	7.25%, then 8.25%, 9.25% and 9.95% per annum; monthly cash pay	The rate-step dates are redacted. No dated interest-expense forecast can be inferred from the commitment alone. [SHAZ-8;SHAZ-9]
Facility B interest	9.95% per annum; monthly cash pay	Fees are additional. Overdue amounts attract an additional 2 percentage points; section 8.4 also permits a redacted increase following the specified material-contract default process. [SHAZ-8;SHAZ-9]
Maturity and repayment	Each tranche matures 42 months after its own first utilization, with bullet repayment	A calendar maturity date is not established without first-draw dates. A is expected to be repaid from customer escrow deposits after acceptance; this remains conditional. [SHAZ-8]
Guarantee and security	The parent initially guarantees both A and B; security includes project assets, accounts, shares and material contracts	Parent release and transition to non-recourse follow A repayment and specified conditions. Management/IP obligations through a separate subsidiary remain excepted. The financing is not already non-recourse today. [SHAZ-8;SHAZ-9]
Prepayment and covenants	Specified B prepayments or acceleration during the first 18 months after utilization carry a make-whole; loan-to-value and other covenants apply	Commitment, draw, customer acceptance, escrow release and debt repayment must be reconciled separately. [SHAZ-8]

Conditional cash-interest scale: if both tranches were fully drawn and outstanding for a full year, base cash interest would be USD 150M × 7.25% + USD 206M × 9.95% = **USD 31.372M annually** at A's first rate, rising to USD 356M × 9.95% = **USD 35.422M annually** at its final rate, before fees, default increments, repayment or changes in drawn balances. This is an arithmetic illustration, not reported interest expense or a forecast of actual utilization. Financing interest remains below operating profit in this artifact's unchanged valuation convention.

Treatment in the retained model: this financing evidence supports execution of the existing 120 MW contracted / 92 MW additional-capacity case. It does not identify a new capacity cohort, prove the entire 212 MW plan is funded, or establish that this facility is allocated to all of the additional 92 MW. Existing recognition factors, the 60% optionality probabilities, revenue, OP, diluted-share path, multiple, ceilings and both Bases remain unchanged. The October 1 issuer release describes a plan for **over 68,000 NVIDIA GPUs by mid-2027**, updating the earlier over-64,000 plan; the newer GPU count must be reconciled with the same MW and customer cohorts before any incremental units or revenue are recognized. Its cumulative capital-secured headline is not a current cash balance. [SHAZ-10]

4. Local evidence and calibration packet

Level 1 SEC filings and issuer announcements anchor current financials, contracts, capital and customer acceptance. Full management Q&A supplies unit economics and timing. Legacy calibration is 1.931381M revenue and 1.169626M GP in Q2; it cannot validate a new multi-billion-dollar deployment. A separate contract calibration is available: the 778.6M annual non-NVIDIA contracts divided by the inferred 48 MW outside AICP =16.221M/MW-year,8.14% above management's 15M benchmark. That is within 10%, but 48 MW is inferred from 120-72 and contracts have different densities. The guaranteed AICP floor is lower per MW and must not be blended into the same retail-price calibration. Future operating economics remain LOW confidence.

5. Summing thesis score

Category	Points / maximum	Evidence
Core thesis	15/20	Accepted cluster delivery, prepaid take-or-pay demand, power access and NVIDIA minimum-revenue support create a deployment window. Data gravity adds switching cost; durable exclusivity is unproven.
Cycle stage	8/10	First accepted large deployment precedes the main revenue ramp.
TAM expansion	9/10	Current 120 MW contract book plus 92 MW secured pipeline, premium-price resale and storage intensity expand the serviceable opportunity; no new capacity beyond 212 MW is invented.
Catalysts	4/5	Contract acceptance, quarterly revenue and funding milestones.
Macro	9/10	Management describes broad APAC and US customer demand above available supply; grid, GPU and sovereignty constraints support the deployment window.
Alpha	4/5	Commercial floor-versus-premium economics and contract/financing sequencing create analytical value beyond headline TCV.
Risks	-5	Funding, dilution, execution, customer/partner economics and hardware obsolescence.

Sum: 44/60 × 100 = 73.333333%, conventionally rounded to 73%. This advisory thesis score does not replace any portfolio Base override. The separate risk classes below total the displayed deduction; holding status and classification do not waive that deduction.

6. Revenue sources, capture and product margins

The five announced commitments sum to USD 8.793 bn TCV: NVIDIA4900/6, ESDS1250/5, global technology 950/5, NZ lab 1320/5 and AI platform 373/5, divided by 4 for a full quarter. Recognized-quarter factors represent service availability after delivery, not GPU utilization: take-or-pay billing can continue irrespective of actual usage. NVIDIA full billing begins Q3 2027 per management; other 2026 contracts ramp through Q4. Q4 average billing differs from December exit billing. At full year-end service for ESDS/global/AI platform, the run rate is 514.6M plus 7.726M legacy, above the earlier 470M exit indication. The model adds two explicit probability-weighted options: (1) net retained AICP premium above its guaranteed floor and (2) conversion of 92 MW outside the existing 120 MW. Each has 60% probability and an identified unit base; these probabilities appear in the factors, not hidden a second time in margins. Premium uses USD 4/hour ×40,000GPUs ×8,760 hours less the existing 816.667M annual floor, then 50% retained share assumed; the actual incremental sharing percentage is not disclosed. Additional capacity uses 92 MW ×USD 15M/MW-year, phased to customer service over 2027/28. No AICP resale floor,600PB storage commitment or new contract on the same GPUs is added twice. Margins deduct modeled depreciation and power/colocation costs before overhead. All periods are calendar quarters. Forward dilution is a 60M fully-converted allowance increasing to 75M with the expansion/compensation path; no share issuance is asserted to have occurred merely because it is modeled.

Vector	Actual calibration / source	Forward demand and capture	Margin derivation / constraint
NVIDIA supported minimum	4900M /6 /4 =204.166667M per full quarter. [SHAZ-2;SHAZ-6]	H1 2027 deployment; full-quarter billing from Q3 2027. The service-availability path is separate from the future resale premium.	At full scale,72 MW×39M capex/MW÷6-year life +72 MW×1.5M annual power/colocation/service cost yields 29.469% GP on 816.667M annual floor. Capex benchmark is management; six-year life and 1.5M cost are analyst assumptions.
ESDS	1250M /5 /4 =62.5M. [SHAZ-3;SHAZ-7]	PartialSeptember billing and material Q4 ramp; average Q4 service factor 75%, year-end exit 100%. No optional two-year renewal is added.	Non-NVIDIA GP uses the common capital-cost bridge described below; interim commissioning costs lower early margins.
Global technology customer	950M /5 /4 =47.5M. [SHAZ-3;SHAZ-4]	Initial accepted deployment is verified; remaining clusters ramp to modeled full exit 2026 service. First acceptance is not acceptance of all 950M.	Same explicit retail-contract cost bridge, with early ramp friction.
New Zealand AI lab	1320M /5 /4 =66M. [SHAZ-2]	Recognition starts Q1/Q2 2027; factors 15%/50%/80%/100% across 2027. Storage intensity remains inside the contract.	Same capital-cost bridge; denser storage could change both revenue mix and costs, requiring contract data.
AI platform B300	373M /5 /4 =18.65M. [SHAZ-2;SHAZ-6]	Q4 average 50% then full service 2027. Source pricing above USD 4/hour supports a market benchmark, not an assumption all different GPU contracts share exactly that price.	Same retail-contract margin bridge; no second separate hourly revenue line for these GPUs.

Vector	Actual calibration / source	Forward demand and capture	Margin derivation / constraint
Existing small cloud business	Q2 actual 1.931381M per quarter. [SHAZ-1]	Held constant, with no large unsupported legacy expansion.	40% GP forward proxy versus 60.56% actual small-business GP; current tiny scale does not establish mature cluster margins.
AICP retained premium	(40000×8760×USD 4-816.667M)×50% /4 =73.116667M maximum modeled retained premium per quarter. [SHAZ-6]	60% probability; ramp 40%/60%/80%/100% of premium conversion from Q3 2027 to Q2 2028.50% incremental sharing is assumed because the exact split is undisclosed.	85% incremental GP after sharing and marginal service cost; depreciation and base power are already charged to the minimum-revenue vector. This is net economic revenue, not asserted GAAP presentation.
92 MW customer conversion	92×15M /4 =345M gross full-service quarterly revenue. [SHAZ-6;SHAZ-7]	60% probability; gross capacity equivalent 10/20/40/60/80/92 MW across Q3 2027-Q4 2028. The product of 60% and capacity/92 is visible in each factor.	Mature 38% GP =1-[(39/5)+1.5]/15, with lower ramp margins. These capital/service assumptions apply to this additional capacity only.

Confidence: reported historical totals are HIGH. Source-based forward extrapolations are MEDIUM only where the cited source sizes the relevant period; other product allocations, future capture and margin assumptions are LOW. A source for the historical anchor does not make an unsourced future factor management guidance. The detailed factors below are the single modeled base case, with uncertain assumptions exposed for review.

V1. NVIDIA supported contracted compute

Sources: SHAZ-2; SHAZ-6. Revenue = anchor × factor; GP/contribution = revenue × displayed product margin. Forecast confidence: LOW unless a specific actual/guided total is identified above.

Quarter	Revenue anchor	Demand / conversion factor	Revenue	Product margin	GP / contribution

7. Operating-cost bridge and quarterly operating model

For non-NVIDIA signed contracts, an inferred 48 MW×USD 39M capex/MW amortized over 5 years plus USD 1.5M/MW-year service costs gives USD 446.4M annual cost, leaving USD 332.2M GP on USD 778.6M sales (42.6663%). The USD 39M benchmark comes from the Q1 call; asset lives and USD 1.5M power/colocation/service cost are analyst assumptions. The latter comprises an indicative USD 0.10/kWh×8,760 hours =USD 0.876M per fully loaded MW-year plus USD 0.624M for other facility/service cost, not an actual electricity contract. Full load is a simplification. Corporate/technical overhead remains a separate revenue-rate path,90% during the tiny launch quarter falling toward 10% as the platform scales. Hardware depreciation is in product costs. Interest and fair-value debt remeasurements are not operating profit; future cash funding must still cover them.

Profit basis: Modeled operating profit after hardware depreciation and service costs, before financing and tax; AICP premium shown net of assumed partner sharing. Amounts below are USD millions.

Quarter	Status	Revenue	GP / contribution	Opex %	Opex	OP margin	Operating profit	Main driver	Confidence

OP = sum of product GP/contribution - explicit operating costs. OP margin = OP ÷ revenue. Displayed numbers are rounded for reading; the workbook calculates from unrounded inputs. Guidance assigned to a future quarter retains Model status because guidance is not an actual result.

8. Multiple, shares and recognition convention

20× modeled forward OP is the company-specific ceiling input for a capital-intensive deployment platform with contracted revenue and expansion options. The service moat has a time limit and refresh spending remains material. This is not 20× EBITDA or net income. No terminal hardware resale value is added, and the model does not present contracted turnover as equity value.

Issued common shares atAugust 5 total 35.803505M (A+B). June financing issued 6.374823M pre-funded warrants, but warrant exercises must be deducted from remaining instruments:USD 370 exercise cash at USD 0.0001 suggests 3.7M shares already issued. This is an inference supported by the equity roll-forward, not a current transfer-agent register; the implied remainder is 2.674823M. Initial principal conversion adds 350/48.24=7.255390M and 700/99.66=7.023881M. Including 34,190 options,922,610 unvested RSUs and up to 444,982 legacy warrant shares gives an illustrative 54.159381M gross full-issuance total before conversion adjustments, overlapping vested awards and new financing. The model uses 60M initially to allow for uncertainty, rising to 75M with expansion and compensation; the allowance is not an announced issuance. The 11.292009M May-note maximum registration replaces that note’s initial conversion count when applicable, rather than adding again. Converted debt is not also subtracted in the OP convention. [SHAZ-1;SHAZ-5]

The valuation denominator is the ceiling quarter’s diluted-share proxy. It is not a historical EPS weighted-average assumption disguised as a fully known future capitalization. Unit factor: 1; this converts the model units to USD per share. No cash balance, enterprise-value adjustment or after-tax earnings substitution is added to the operating-profit ceiling.

- **Q3 2027:** (92.860112 + 114.673112 + 136.961093 + 161.674553) × 20 × 1 ÷ 62.000000 = **163.280281 USD/share**. Window: Q3 2027-Q2 2028.
- **Q4 2027:** (114.673112 + 136.961093 + 161.674553 + 177.847644) × 20 × 1 ÷ 63.000000 = **187.668699 USD/share**. Window: Q4 2027-Q3 2028.

- **Q1 2028:** (136.961093 + 161.674553 + 177.847644 + 188.260734) × 20 × 1 ÷ 65.000000 = **204.536623 USD/share**. Window: Q1 2028-Q4 2028.
- **Q2 2028:** (161.674553 + 177.847644 + 188.260734 + 191.518824) × 20 × 1 ÷ 67.000000 = **214.716942 USD/share**. Window: Q2 2028-Q1 2029.
- **Q3 2028:** (177.847644 + 188.260734 + 191.518824 + 194.776914) × 20 × 1 ÷ 69.000000 = **218.088149 USD/share**. Window: Q3 2028-Q2 2029.
- **Q4 2028:** (188.260734 + 191.518824 + 194.776914 + 194.776914) × 20 × 1 ÷ 71.000000 = **216.713630 USD/share**. Window: Q4 2028-Q3 2029.
- **Q1 2029:** (191.518824 + 194.776914 + 194.776914 + 194.776914) × 20 × 1 ÷ 71.500000 = **217.020858 USD/share**. Window: Q1 2029-Q4 2029.
- **Q2 2029:** (194.776914 + 194.776914 + 194.776914 + 194.776914) × 20 × 1 ÷ 72.000000 = **216.418794 USD/share**. Window: Q2 2029-Q1 2030.
- **Q3 2029:** (194.776914 + 194.776914 + 194.776914 + 194.776914) × 20 × 1 ÷ 72.500000 = **214.926250 USD/share**. Window: Q3 2029-Q2 2030.
- **Q4 2029:** (194.776914 + 194.776914 + 194.776914 + 194.776914) × 20 × 1 ÷ 73.000000 = **213.454153 USD/share**. Window: Q4 2029-Q3 2030.
- **Q1 2030:** (194.776914 + 194.776914 + 194.776914 + 194.776914) × 20 × 1 ÷ 73.500000 = **212.002084 USD/share**. Window: Q1 2030-Q4 2030.

10. Annual trajectory cross-check

Calendar year	Revenue	GP / contribution	Opex	OP	OP margin
2027	1,428.312	510.723	226.457	284.266	19.902%
2028	2,381.698	946.167	281.423	664.744	27.911%
2029	2,606.472	1,039.755	263.905	775.850	29.766%
2030	2,606.472	1,039.755	260.647	779.108	29.891%

These are calendar-year sums of the quarterly path, not extra revenue and not the live valuation method. For non-December fiscal reporters, fiscal guidance and these calendar totals must be aligned using the period mapping above; a four-quarter run rate is not automatically the same fiscal year. Outer-year outputs are conditional TAM/capture trajectories, not verified management sales targets.

The five current commitments reach about USD 1.595 bn annual service revenue. The two explicit options can add USD 175.48M retained premium and USD 828M probability-weighted 92 MW revenue at the modeled mature conversion, plus the small legacy business. This checks an expanded operating-revenue envelope of approximately USD 2.606 bn, not a company guidance number. Full physical 92 MW deployment at the source-period USD 39M/MW benchmark represents USD 3.588 bn gross capex before deposits/debt; weighted revenue is not a claim the funding is complete. The 212 MW footprint,600PB storage commitment and earlier over-64,000-GPU deployment target are different measurements of overlapping assets, not additive TAM. The October 1 plan for over 68,000 GPUs by mid-2027 updates the GPU headline without a reconciled incremental MW or customer-revenue bridge; it is not added to the existing cohorts. [SHAZ-10]

11. Dilution sensitivity - same operating case

Denominator sensitivity	Q3 2027 shares M	Q3 2027 ceiling USD	Effect on ceiling
-5% shares	58.900000	171.873980	+5.26%
+0% shares	62.000000	163.280281	+0.00%
+5% shares	65.100000	155.505029	-4.76%
+10% shares	68.200000	148.436619	-9.09%

This isolates denominator uncertainty; it is not a second bull/bear operating case or permission to remove known dilution. The base case remains the explicit share path in the rolling table.

12. Programme and probability ledger

Programme / signal	Source and probability	Amount / unit base	Treatment in this model	Escalation / recognition
Five signed commitments	Issuer contracts / management;90% execution confidence	8.793 bn TCV;1,595.267M annual full-service run rate	Full contractual amounts conditional on service; factors govern recognition, not a second probability haircut	Acceptance and repeat cash receipts 95-100%; adjust exact delivery quarters.
AICP premium resale	Management says demand above floor;60% modeled probability	584.933M gross annual premium at USD 4/h;50% retained =292.467M before 60% probability	175.48M probability-weighted annual net premium at full modeled conversion	Named resale price and sharing agreement→80%; accepted billing→95%; replace both assumptions, do not add the resale floor twice.
Available 92 MW	Secured sites plus management customer discussions;60% probability	92×15=1,380M gross annual revenue;60%=828M weighted full-service revenue	Separate from current 120 MW; deployment/contract ramp 2027/28	Signed financed offtake→80%; accepted service→95%; include matched capital needs.
Storage upsell / additional AICP allocation	Management opportunity;55%	No supported separate incremental contract amount beyond included book	Unquantified; no stand-alone extra revenue	Documented incremental capacity/storage contract allows pricing net of existing commitments.
Vera Rubin / later expansion	Management customer conversations;55%	No committed extra MW or contracted price in located record	No revenue beyond 212 MW assumed	A funded site+GPU+customer agreement defines a new incremental vector.

Probabilities are analyst judgments under the framework signal hierarchy. Embedded revenue is not multiplied or added a second time. Where no defensible amount or unit base exists, the opportunity remains explicitly unquantified; confidence alone cannot create a revenue number. New evidence can enlarge the TAM, improve

capture or move recognition earlier, but each requires an identifiable model input.

13. Scored risk classes

Risk class	Scored deduction	Mechanism and consequence
Funding / cash timing	-1	Capex installments, deposits, debt drawdowns and service receipts must align. The USD 356M conditional commitment is not verified drawn cash; monthly cash interest, conditional escrow repayment, initial parent recourse and bullet maturities remain funding obligations. Cash versus total multiyear commitments is not a dated liquidity bridge. [SHAZ-8;SHAZ-9]
Dilution / capital structure	-1	Prefunded warrants, converts, awards and future expansion capital affect common-share economics; fully diluted proxy is conditional.
Delivery / operating execution	-1	Power readiness, GPU/network delivery, configuration and acceptance can delay billing or require remediation.
Counterparty / commercial terms	-1	Take-or-pay enforceability, NVIDIA incremental sharing and customer concentration affect cash collection and the profit retained.
Hardware obsolescence / margin	-1	Useful lives, replacement capex, service costs and future rental prices can reduce economic returns despite contracted revenue.

14. Dated catalysts, counters and escalation

1. **2026-11-15 monitoring date (Q3 reporting window) - Reconcile actual accepted clusters and revenue with the initial service factors.** An installation announcement without billable acceptance leaves recognition pending.
2. **2026-12-31 - Test year-end exit service for ESDS/global/AI platform against the at-least 470M annualized indication.** Quarter-average revenue can be lower than the exit rate; a genuine exit shortfall requires a new deployment bridge.
3. **2027-06-30 - Check the latest plan for over 68,000 GPUs and the AICP first-half schedule.** Reconcile the October 1 GPU plan to the existing contract/MW cohorts before adding incremental capacity. GPU receipts without networking, power and acceptance do not establish billed capacity. [SHAZ-10]
4. **2027-09-30 - AICP full billing target; verify base rate, realized retail premium and actual NVIDIA sharing percentage.** Premium confidence 60%→80% on signed price/share terms→95% on accepted invoices; recompute net retained economics.
5. **2027-12-31 - Test 212 MW physical readiness and incremental 92 MW contract/funding conversion.** If no financed customer contracts emerge, reduce probability and shift the pipeline rather than pretending secured land/power is revenue.
6. **Every quarter through 2030 - Reconcile shares, convert terms, capex payment dates, deposits, debt drawdowns, depreciation and cash collection.** Useful-life shortening, expensive funding or dilution beyond the proxy changes OP/share economics; it does not change protected portfolio Base automatically.

15. Cross-book monitoring

NBIS ↔ SharonAI: compare accepted capacity, contracted economics, prepayments, depreciation and funding by deployment cohort. NVDA ↔ SharonAI: GPU sales and shared premium are supplier economics and operator costs/claims; NVIDIA's guaranteed floor should not be mistaken for a cap on SharonAI revenue. DELL/PENG and other OEM/integrators ↔ SharonAI: lead times and test/installation capacity constrain service dates. Memory/storage/optics ↔ SharonAI: higher storage per 1,000GPUs and networking are upstream demand signals within the same clusters; they do not generate a second SharonAI revenue stream. No other artifact or workbook Base is altered.

16. Source register and model limits

SHAZ-1 - Q2 2026 Form 10-Q (2026-08-06). Q2 revenue 1.931381M and OP loss 24.784178M. Cash is about USD 1.86 bn and infrastructure purchase commitments approximately USD 6 bn over their contractual periods. August 5 issued common shares total 35.803505M. Pre-funded warrants and both convertible issues require a forward share bridge; accounting diluted EPS during a loss period does not capture all potential dilution.

SHAZ-2 - Q2 results and management commentary (2026-08-06). TCV USD 8.8 bn; NVIDIA collaboration 4.9 bn over six years. Added contracts include USD 1.32 bn and USD 373M over five years. Management expects a material ramp from Q3 2026 through 2027, targets over 64,000 GPUs by mid-2027 and reports 212 MW secured. No quarterly recognized-revenue or OP guidance is supplied.

SHAZ-3 - Q1 results and management commentary (2026-05-15). ESDS contract: USD 1.25 bn over five years, 8,000 B300s, expected revenue start Q3 2026. The USD 950M five-year global-technology contract was expected to start in stages in Q3/Q4 2026.

SHAZ-4 - Issuer announcement: initial customer acceptance (2026-08-20). Initial deployment accepted under the USD 950M contract, releasing escrow security. Further clusters remain to be delivered. Secured capacity is 212 MW, with 120 MW contracted under multi-year take-or-pay agreements. This verifies a milestone, not acceptance of the entire contract.

SHAZ-5 - May convertible resale registration (2026-06-05). Registration covers up to 11.292009M shares for the USD 350M issue including specified interest and maximum conversion adjustments. Initial-rate principal conversion is smaller; these are alternatives, not additive shares.

SHAZ-6 - Q2 full management call and Q&A (Quartr rendering) (2026-08-06). NVIDIA floor retained 100%, premium above floor shared.212 MW secured,120 MW contracted,92 MW available. AICP deployment H1 2027 and full billing by Q3. Record B300 pricing above USD 4/GPU-hour; Vera Rubin discussions forlate 2027/28. No post 212 MW guidance.

SHAZ-7 - Q1 full management call and Q&A (Quartr rendering) (2026-05-15). Management indicated at least USD 470M exit 2026 annualized revenue, around USD 15M revenue/MW-year and USD 39M all-in capex/MW. Contract deployment 3-7 months; storage upsell and prepayment terms discussed. These are source-period operating benchmarks, not a promise of every future contract's economics.

SHAZ-8 - Form 8-K, Item 1.01: senior secured facility (filed 2026-10-01; agreement 2026-09-28). Up to USD 356M, A150M/B206M, conditional utilization, monthly interest, separate 42-month maturities, initial parent guarantee for both facilities, collateral, prepayment terms and conditional transition to non-recourse. No drawn balance is established in the reviewed disclosure.

SHAZ-9 - Facility agreement, Exhibit 10.1 and Guarantee Deed Poll, Exhibit 10.2 (2026-09-28; filed 2026-10-01). Interest Rate definition, printed page 21, provides the four A rates with redacted transition dates; section 8.4, printed page 48, sets the special interest-increase process. Parent release remains conditional.

SHAZ-10 - Issuer financing announcement, Exhibit 99.1 (2026-10-01). Over 68,000 GPUs planned by mid-2027 and over USD 8.8 bn TCV. These are deployment and contract measures, not installed capacity, current cash or recognized revenue.

The full two-call protocol is covered. The five contract values and capacity envelope are sourced; contract-level acceptance, cost budgets and the incremental NVIDIA sharing percentage remain partly undisclosed. The 92 MW and retained-premium options are probability-weighted analyst estimates, not signed incremental revenue. A dated financing drawdown schedule and exact remaining warrant register remain open. Model revenues use a net retained-premium convention, which may differ from future GAAP gross/net presentation. No protected portfolio Base is changed.

Workbook: G:\My Drive\1amInvesting\Artifacts\v3_2_master_portfolio.xlsx, model tab SHAZ_Q_Model. It owns portfolio ranking, prices and return calculations; those remain workbook-owned. **Current artifact path:** G:\My Drive\1amInvesting\Artifacts\SHAZ_SharonAI_DeepDive_2026.md. **Original snapshot:** versions/originals/SHAZ_SharonAI_DeepDive_2026.md. Superseded history is retained separately in VERSION_LOG, not in this current-state model.
