Taiwan Semiconductor Manufacturing Company

TSM | NYSE ADS; underlying 2330 Taiwan Stock Exchange | 2026-10-11

Q4 2027 model ceiling: USD 624.40

Analytical Base 50/60 = 83 | High Conviction / structural qualified-capacity bottleneck

20x forward-four-quarter normalized IFRS operating profit attributable to parent, plus fixed opening surplus liquidity less face debt, lease and pension claims, divided by end-window ADS-equivalent shares. Each ADS represents five ordinary shares; Q prices Q plus the next three quarters.

Coverage initiated at the owner's request. No holding was established by this research. The portfolio Base remains83; no manual override is introduced.

All operating values are in USD million and shares in millions unless stated otherwise. Forecasts are analytical assumptions; issuer guidance and actual results are identified separately.

Writing-date snapshot: USD 472.20 per share (2026-10-07 close); 5,186.474 million full-company ADS equivalents (June30 full-company ADS-equivalent); estimated equity capitalization USD 2,449,053.0 million. ADR-equivalent capitalization; not the number of traded depositary receipts. Vendors differ by a few cents at the close; use the $472.20 official-close series consistently. This dated ADS-equivalent snapshot is separate from forecast diluted shares.

October 11 monthly-sales update: what changed

NTD thousands 1,494,243,284 / 1,000 / 32 = USD 46,695.102625m; six prior product shares scale proportionally. R&D 2,000 + 2.05% sales; SG&A 610 + 0.8% sales; consolidated OP less existing 0.1% minority reserve. GP/OP are modeled, not reported actuals.

No extrapolation: Q4 2026 remains USD 51,200m, already 9.65% above preliminary Q3 at model FX. Existing 2027 active sales of USD 226,254.2m already imply 30.03% growth against the revised 2026 bridge. Monthly revenue does not identify a new repeatable node mix, price, margin or qualified-capacity increase beyond those assumptions. No incremental later-quarter probability or revenue is added for this realized-sales observation; Q3 results and Q4 guidance are the next test. The Q3 2026 ceiling moves from USD448.59 to USD452.22 (+0.81%). The active Q4 2027 ceiling remains USD624.40, and both analytical and portfolio Base remain 83. All valuation multiples, financial claims, ADS conversion and end-window shares are unchanged.

Decision in the model

Active horizon	Earnings window	F4Q OP	Multiple	Diluted shares	Ceiling
Q4 2027	Q4 2027 through Q3 2028	160,972.1	20x	5,198.151	624.40

The ceiling is a model valuation, not a guaranteed trading price or a literal net-income P/E. Operating branches are weighted once. Where debt, preferred claims, conversion or equity floors make value nonlinear, the model values each coherent operating and funding state first, then weights those common-share outcomes.

Economic scope and matching claims

Consolidated wafer and backend service revenue; ordinary depreciation, amortization and awards remain expenses. Nonoperating VIS gains excluded. A rising minority earnings reserve is applied before valuation.. 20x forward-four-quarter normalized IFRS operating profit attributable to parent, plus fixed opening surplus liquidity less face debt, lease and pension claims, divided by end-window ADS-equivalent shares. Each ADS represents five ordinary shares; Q prices Q plus the next three quarters.

Financial claims and diluted shares follow the company-specific schedule below. Debt, preferred and minority claims are counted once. All financial model tables use USD million unless a different unit is stated.

Investment conclusion

TSMC combines scarce manufacturing processes with the design libraries, production experience and packaging needed to turn a chip design into reliable shipped products. Its customer base spans competing GPU, custom-accelerator and CPU architectures. That broad exposure makes it an attractive way to own growing silicon complexity, while avoiding a forecast that requires one architecture to win every workload.

The active model produces a Q4 2027 ceiling of **USD 624.40 per ADS** at **20x forward-four-quarter normalized operating profit**, with an analytical **Base of 83**. The earnings window is Q4 2027 through Q3 2028. This is the framework's operating-profit convention, not a 20x net-income P/E. The largest positive drivers are leading-node volume, backend services and moderate repricing. N2 qualification, overseas costs, customer deployment timing and second sourcing remain explicit risks.

This is a strong business with an already visible moat. The forecast does not require monopoly pricing, uninterrupted AI spending or the elimination of competing foundries. Its more demanding assumption is that qualified output and customer deployments can support annual sales around USD 226.3 billion in 2027 and USD 290.7 billion in 2028. Beyond2028, the forecast is a capacity and economics scenario with lower visibility.

What the company sells

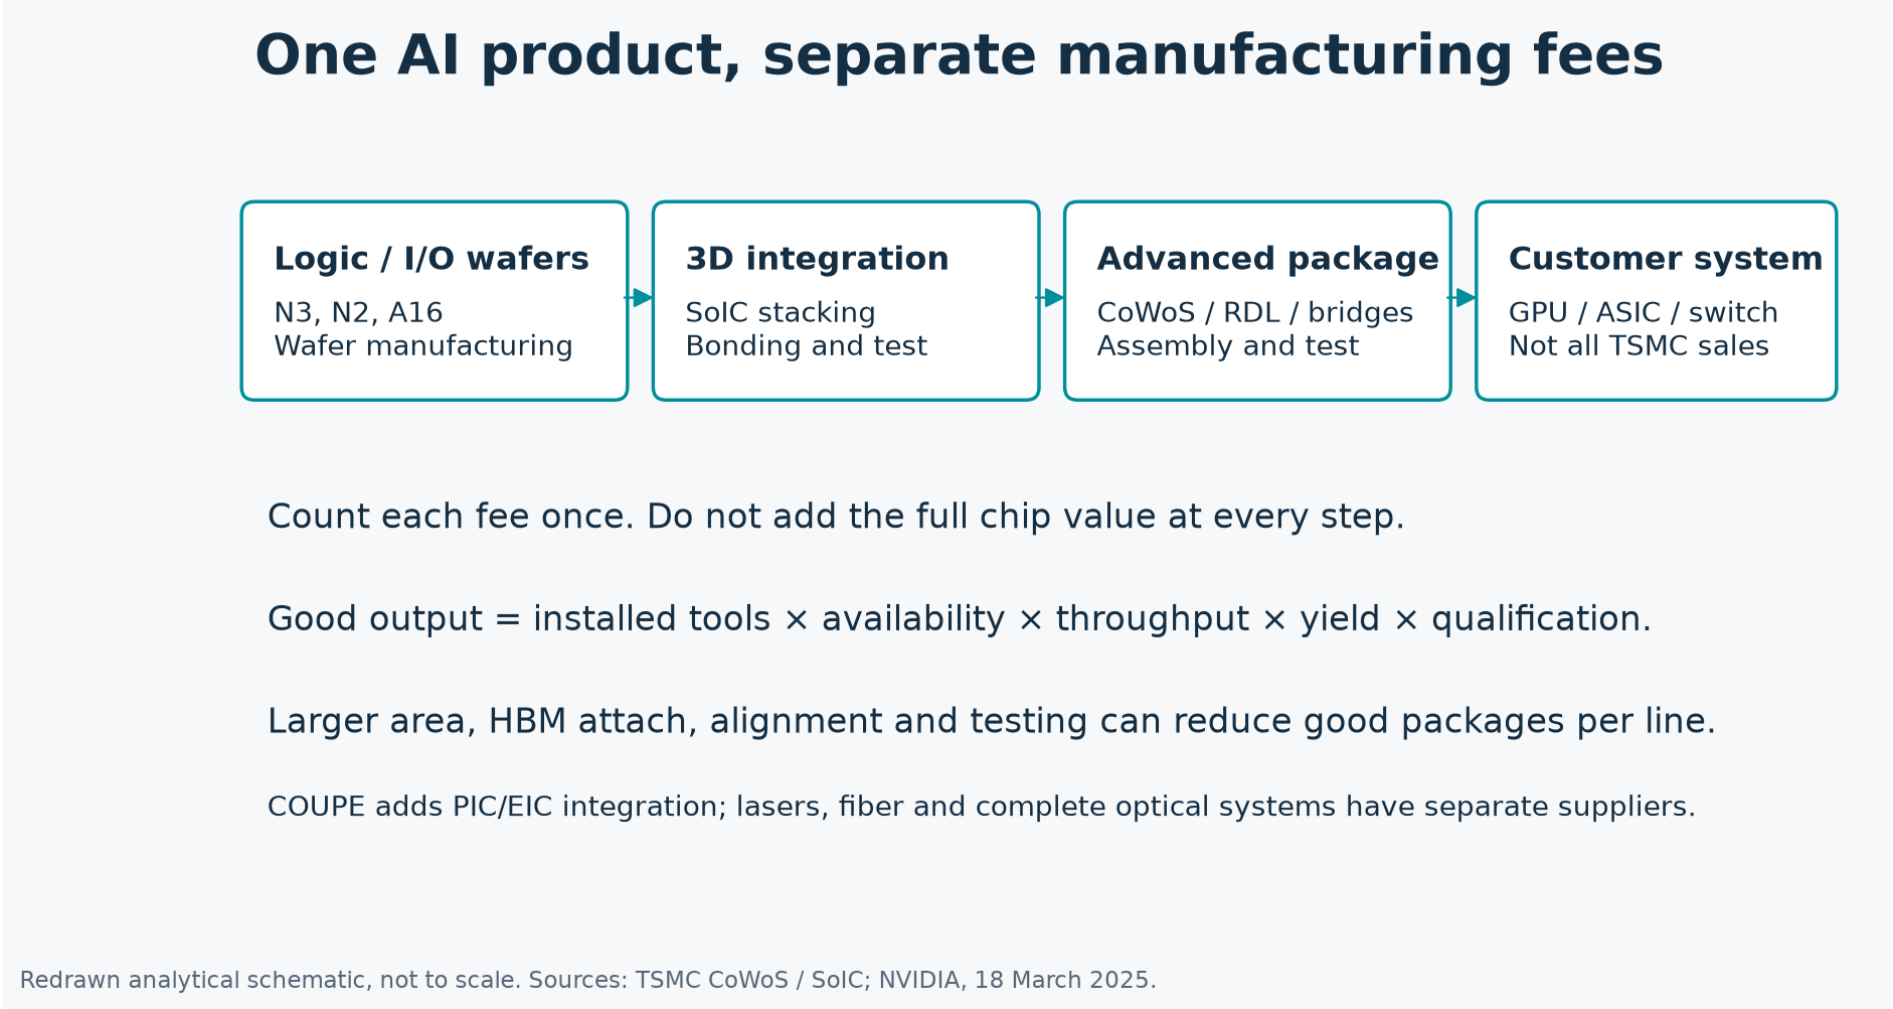

TSMC manufactures customer-designed chips and provides related masks, packaging and testing. A customer pays for its manufacturing and service content; TSMC does not collect the whole selling price of a GPU, server or cloud service. A system with more HBM, optical components or cooling creates TSMC revenue only where TSMC supplies the associated logic, bonding or package services.

The revenue model separates wafer fabrication from non-wafer services. Within wafers it distinguishes N2/A16, N3, N5/N7, mature/specialty and later A14-family products. Platform categories such as high-performance computing and smartphones provide a customer-demand cross-check. They are another view of the same company sales, not additional revenue pools.

Q2 accounts report NT$ 1,073.7 billion of wafer revenue and NT$ 196.7 billion of other revenue. The latter is broader than advanced packaging: it includes testing, masks and services. The model therefore uses a16% other-revenue share inQ3, rising to 18% in 2027 and20% in 2028. Within that total, advanced packaging/testing is a 13%/15%/17% company-sales proxy for 2026-28; roughly 3% is other non-wafer work. The Q3 percentages remain allocation estimates after incorporating

preliminary group sales. Interim accounts

Analytical schematic | Wafer, stacking and packaging fees are separate; customer product value is counted once.

Analytical schematic | Wafer, stacking and packaging fees are separate; customer product value is counted once.

The manufacturing moat

A process is commercially valuable when a customer can design with it, achieve acceptable yield and reliability, and obtain enough qualified production at a useful cost. A transistor demonstration is only part of that chain. Process design kits, libraries, physical implementation, masks, wafer processing, package design and test must work together. Requalifying a complex chip at another foundry takes engineering effort and time, and can require a redesign.

TSMC's scale spreads development expense across many products and customers. Its independence as a manufacturing partner also allows competing designers to share a production ecosystem. These advantages support sustained returns, but they do not make all proposed capacity profitable. A poor customer design can have weak yield even on a capable process; conversely, an excellent test structure does not prove that a very large customer's die has reached its target yield.

For this reason, the Jalapeño yield discussion is a program risk, not measured evidence of a systemic TSMC process failure. The archived engineering critiques do not provide a sampled distribution of wafers, bins, die sizes and process versions. The model retains joint execution risk rather than assigning the whole foundry a new unmeasured yield penalty.

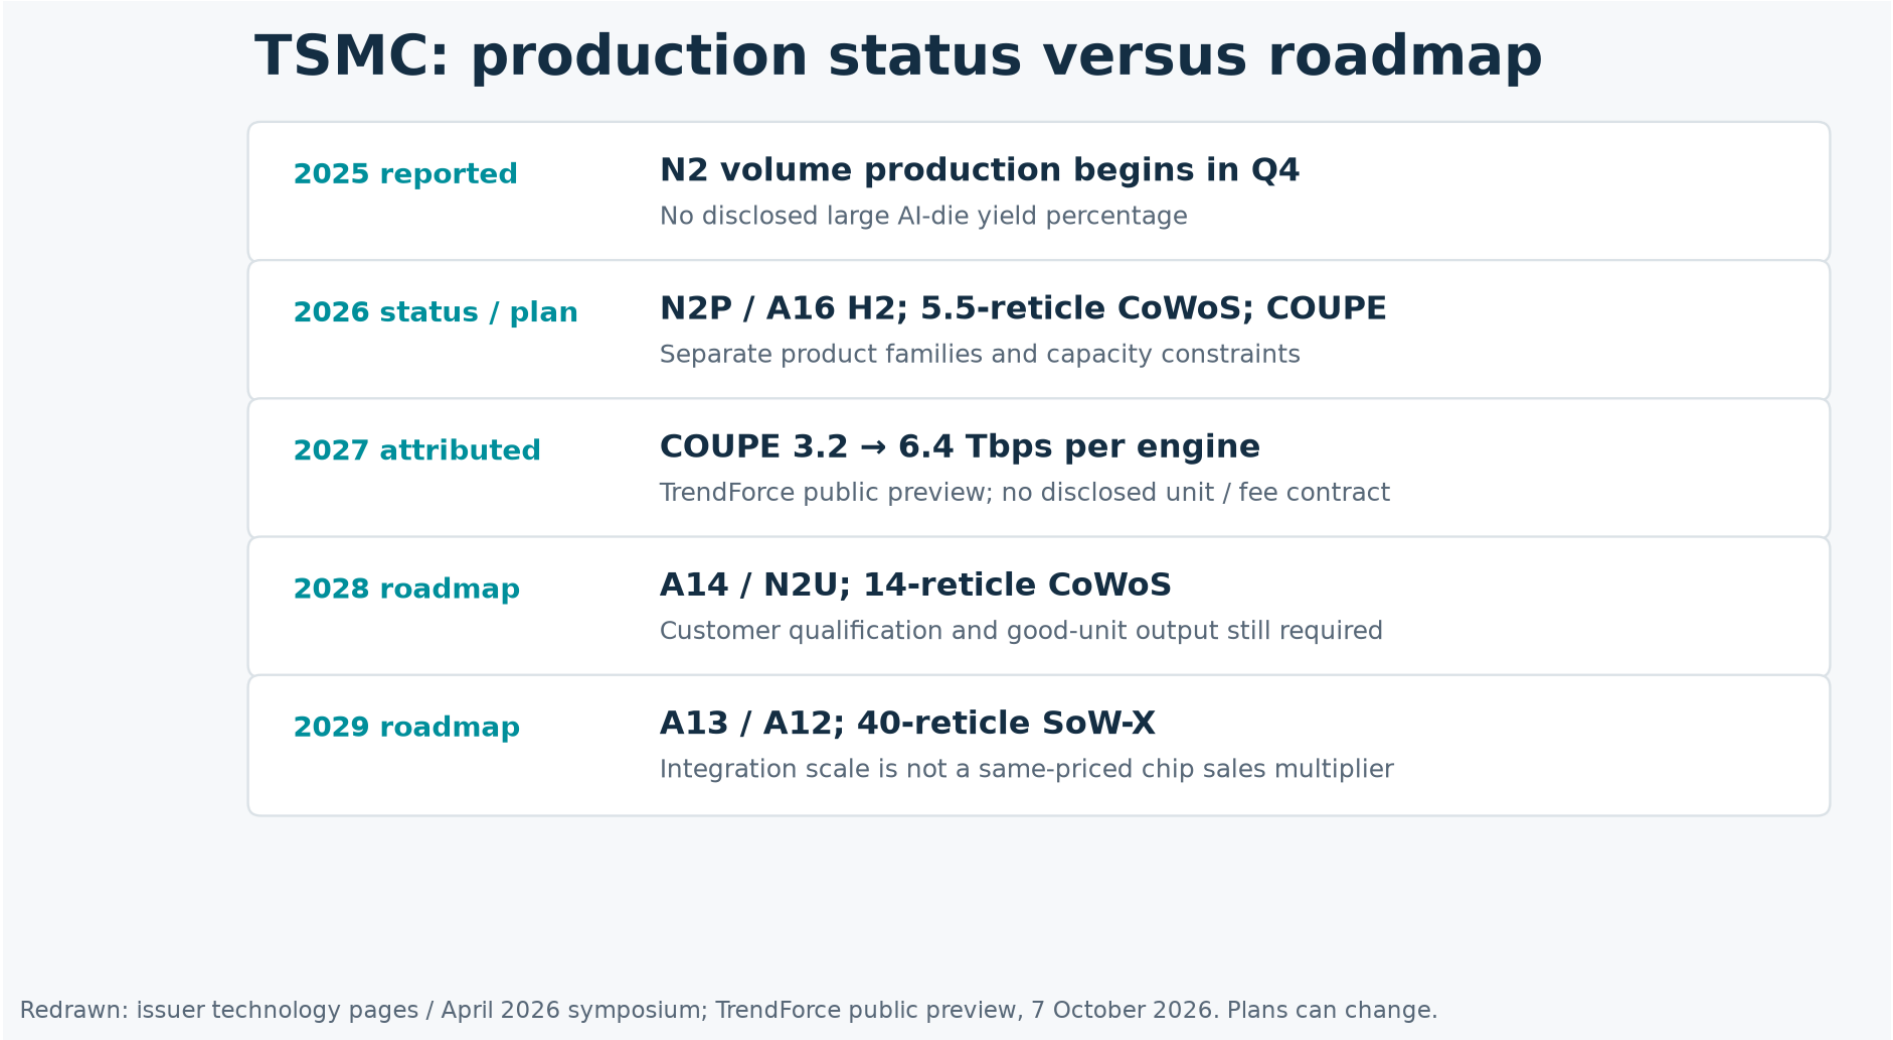

Process and packaging roadmap

The April symposium places A14 volume production in 2028, N2U in 2028, and A13/A12 in 2029. A13 is an optical shrink of A14; A12 adds backside power delivery. These are roadmap commitments, not current recognized sales. Device performance, power and density comparisons have different conditions and cannot be added together as a single performance gain. TSMC symposium

Packaging makes a large chip system manufacturable by joining compute dies and memory with dense connections. CoWoS, SoIC and optical integration address different parts of that system. The symposium reports5.5-reticle CoWoS in production,14-reticle packages planned for2028, and larger systems later. A bigger package can contain more compute and memory while consuming more substrate area, bonding operations and test time. Nominal wafer capacity therefore does not translate one-for-one into finished systems.

The Q1 call described N2's initial production ramp and planned N3 additions in Taiwan, Arizona and Japan. Converting N5 equipment to N3 reallocates tools; it is not simultaneous new capacity in both nodes. Capital spending must precede installation, qualification, utilization and accepted shipments. Q1 management call

Analytical source summary | Reported production and future roadmap status are distinguished.

Analytical source summary | Reported production and future roadmap status are distinguished.

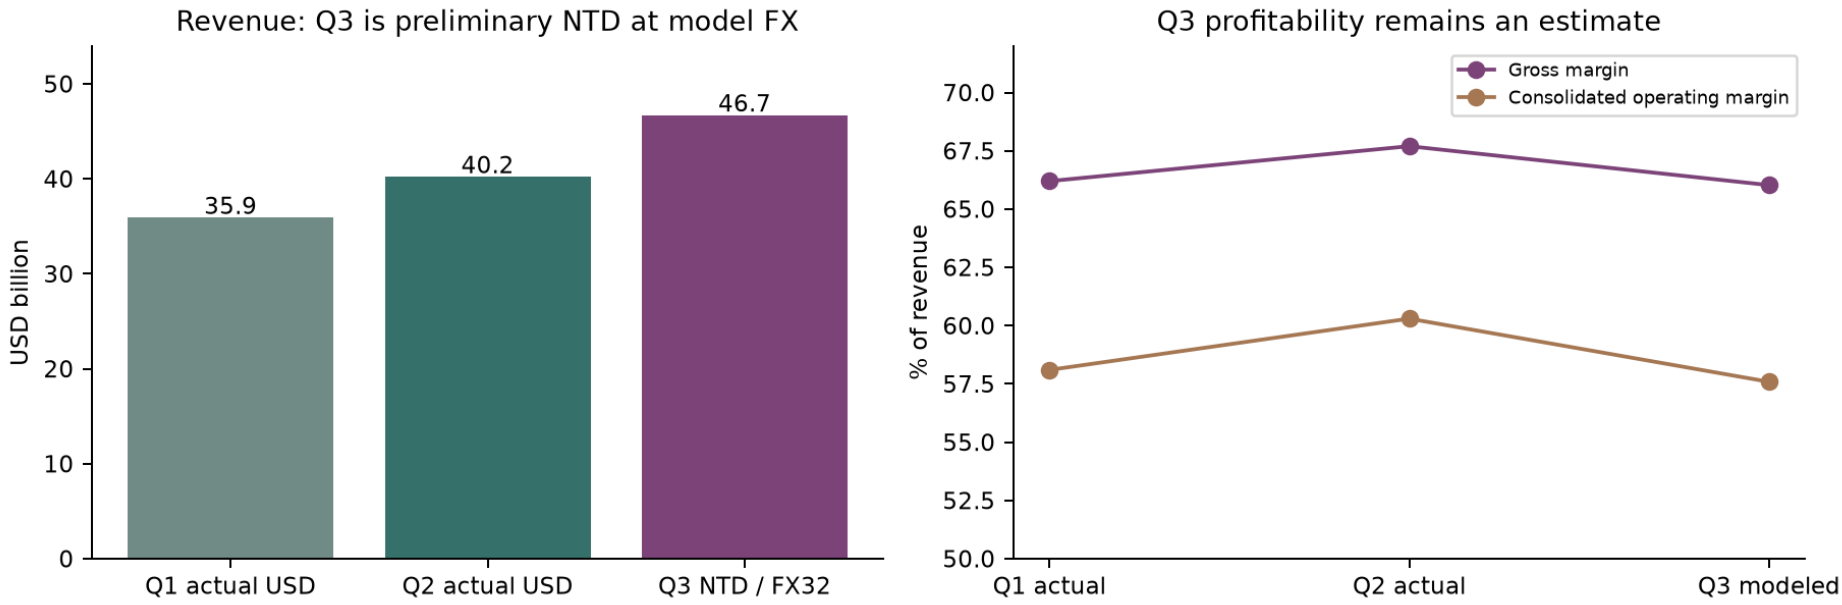

Actual earnings and the forecast starting point

FY2025 revenue was USD 122.42 billion. The first two2026 quarters generated USD 35.90 billion and USD 40.20 billion. Q2 gross margin was67.7% and reported operating margin60.3%. The model preserves research, administration, employee awards and depreciation as expenses. It does not annualize the NT$ 63.2 billion VIS investment gain, which is below operating profit. 2025 accounts Q2 results

For Q3, management guided USD 44.6-45.8 billion of revenue, 65-67% gross margin and 56-58% operating margin at NT$32 per US dollar. The three published monthly revenue disclosures now total NT$1,494.243284 billion. At the unchanged model exchange rate, this is USD 46.695103 billion, replacing the USD45.2 billion estimate. This is preliminary reported NTD revenue translated at a model FX assumption; it is not the company's reported Q3 USD result. The six product allocations remain estimates at their prior shares, with their prior gross margins. That produces modeled gross margin of 66.03% and parent-attributed operating margin of 57.53%. Q3 actual profit and actual USD translation remain pending. September SEC release

The SEC tables report July, August and September sales of NT$467,580,548 thousand, NT$514,805,337 thousand and NT$511,857,399 thousand. Their sum, divided by 1,000 and then 32, is USD 46,695.102625 million. August and September year-to-date changes independently match those monthly figures. The model keeps Q4 at USD51.2 billion, 9.6% above the revised Q3. Using the existing USD35.9/40.2 billion first-half anchors, the revised full-year bridge is USD173.995 billion, about 42.1% above 2025. Existing 2027 active sales of USD226.3 billion already imply about 30% growth. The monthly beat alone establishes no repeatable price, mix, margin or qualified-capacity increment beyond this growth path, so later operating forecasts receive no additional uplift. July SEC release August SEC release

Issuer Q1/Q2 USD revenue; Q3 preliminary monthly NTD sales translated at model FX32. Q3 mix, margins and costs are estimates, not reported results.

Issuer Q1/Q2 USD revenue; Q3 preliminary monthly NTD sales translated at model FX32. Q3 mix, margins and costs are estimates, not reported results.

Customer demand and the revenue bridge

The reference trajectory is USD 227/288/340/380 billion of sales in 2027-30. It is a company manufacturing forecast, not a fixed percentage of global AI capital expenditure. The operating model assigns that wallet to distinct manufacturing vectors, then tests the implied output and mix. Advanced packaging/test reference revenue rises from about USD 22.6 billion in 2026 toUSD 34.1 billion in 2027 andUSD 49.0 billion in 2028. Other non-wafer revenue is separate within the same consolidated total.

Management's latest discussion identifies agentic workloads as an additional CPU opportunity across architectures. The active case assigns60% probability to a bounded incremental foundry wallet: gross customer manufacturing demand ofUSD 8/14/18/20 billion in 2027-30,80% capture, and a50% deduction for demand already in the HPC reference. That leaves conditional annual sales ofUSD 3.2/5.6/7.2/8.0 billion before probability weighting. The allocation is an assumption, not management guidance.

This approach avoids treating the migration from a merchant GPU to an in-house ASIC as an entirely new wafer sale. The same customer compute budget can fund either design. A change in die size, process node or packaging can increase TSMC content, but that increase must be demonstrated in the manufacturing invoice rather than inferred from the accelerator's retail price.

The following platform allocation is an independent check on the same reference revenue. It is not added to the node and backend model. The 2026 HPC estimate is calibrated to roughly USD 48 billion in first-half HPC sales and an assumed stronger second half. The 2027 HPC requirement grows about 44%, slowing thereafter; smartphones and other markets supply the rest. These company invoice pools avoid converting cloud capex into foundry revenue at an arbitrary constant ratio.

Year	Reference sales USD bn	HPC share assumption	HPC invoices USD bn	Smartphone invoices USD bn	Other invoices USD bn
2026	174.0	64%	111.4	40.0	22.6
2027	227.0	70%	158.9	43.1	25.0
2028	288.0	73%	210.2	49.0	28.8
2029	340.0	75%	255.0	54.4	30.6
2030	380.0	76%	288.8	57.0	34.2

Capacity and the price of qualified output

Revenue can increase through more wafers, a richer node mix, more backend content and higher like-for-like prices. The model keeps those drivers separate. Its wafer ASP proxies are USD 30,000 for N2/A16,USD 22,000 for N3,USD 12,000 for the blended N5/N7 pool,USD 3,980 for mature/specialty equivalents andUSD 36,000 for the later A14 family. These are analytical conversion assumptions, not verified contract quotations. They are calibrated against reported equivalent shipments and must be revised if the scope proves inconsistent.

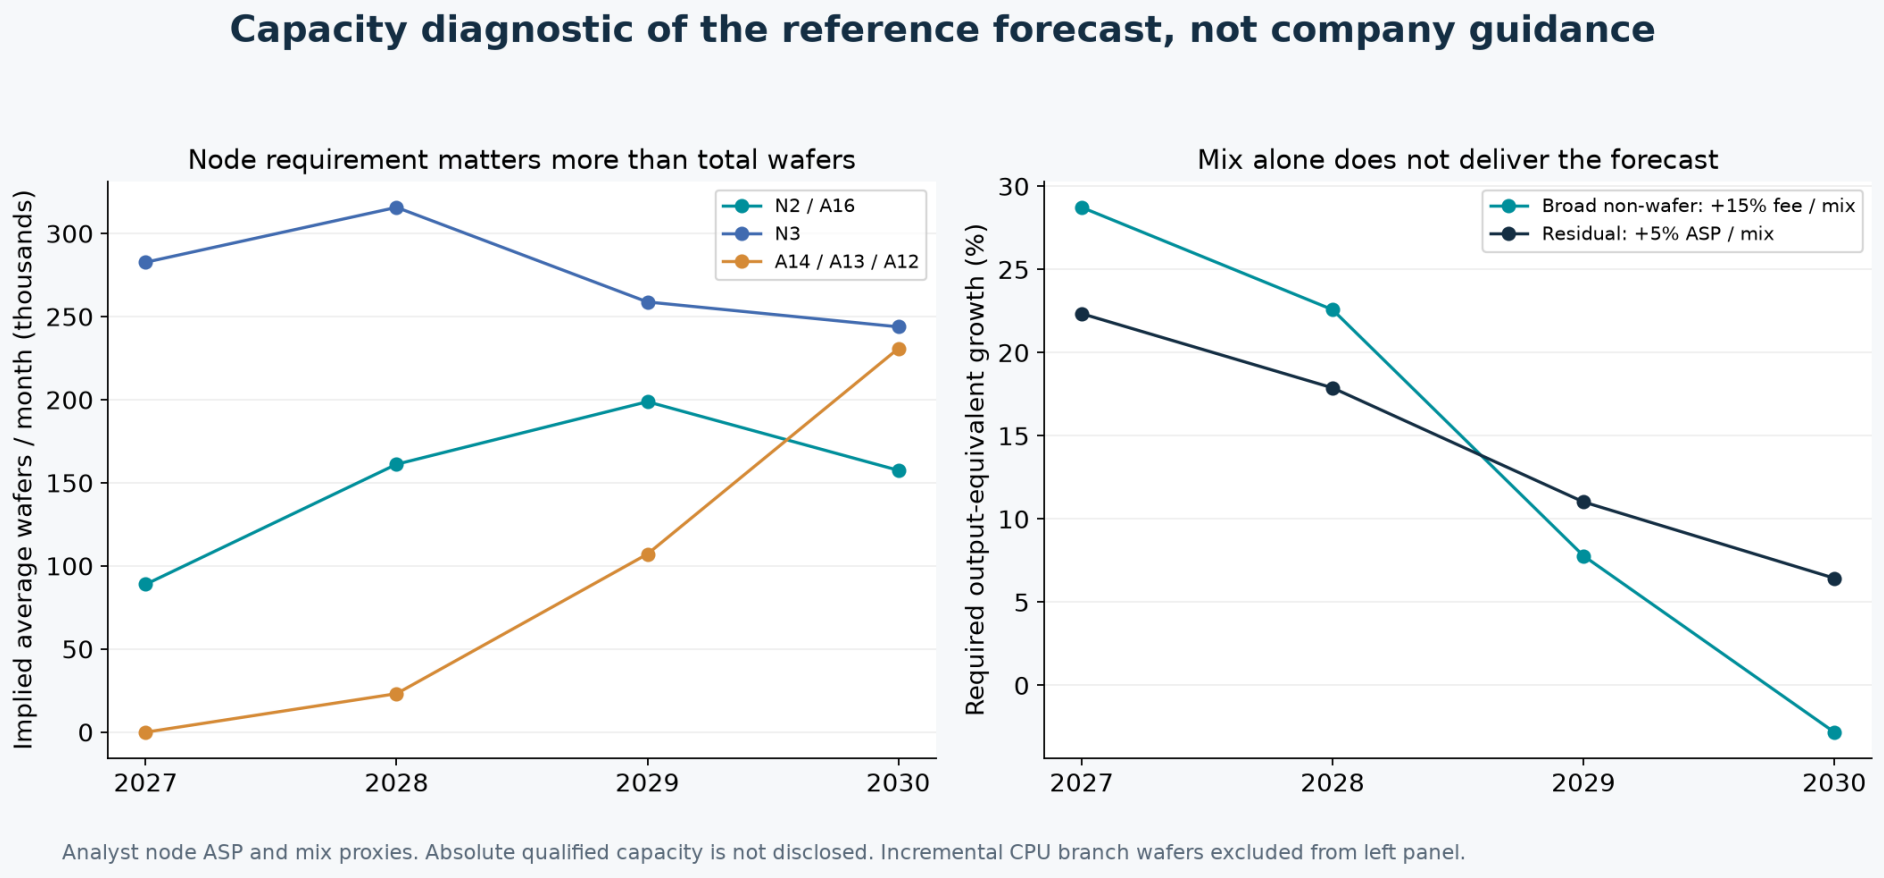

The N2/A16 reference share of wafer revenue rises through 14%,16%,18% and20% in 2027, followed by 22%,24%,26% and28% in 2028. The corresponding volume requirement is shown in the capacity exhibits. This slower early ramp makes N3 do more of the near-term work. It remains demanding: new N3 fabs, tool conversions and yield improvements must generate qualified output on time. A20% lower assumed wafer ASP means25% more wafers are needed for the same revenue; a20%

higher ASP means about 17% fewer. This sensitivity is not proof that capacity exists.

October 6 channel relays suggested5-10% advanced-node price increases, but their numerical original images were unavailable. They are useful forward evidence with a wider uncertainty band. The active price branch uses 65% probability and only 50% eligible/repriceable invoice coverage at a6% conditional increase in 2027, equivalent to 3% on reference N2/N3 sales. A later repost is not a second pricing shock. The source's older USD 55 billion2026 capex estimate is superseded by company guidance ofUSD 60-64 billion.

Of each incremental pricing dollar,85 cents becomes gross profit and3 cents funds incremental operating expense. The remainder absorbs materials, fulfilment costs and concessions. This modest pricing treatment reflects customers' cost of waiting for qualified capacity without assuming that TSMC will maximize short-term scarcity rents. The October 8 capacity revision explicitly cancels the existing price benefit on incremental unserved N3 sales after deducting the old joint-loss overlap. This retains the original pricing probability and costs; scarcity does not create an automatic offsetting price increase.

Analytical model diagnostic | The forecast requires substantial leading-node capacity and accepted backend output; these quantities are model implications.

Analytical model diagnostic | The forecast requires substantial leading-node capacity and accepted backend output; these quantities are model implications.

N3 capacity evidence and conditional delivery risk

The newly reviewed UBS Figure 13 estimates N3 installed capacity at 170/185/195/210 thousand wafers per month in 2027, against demand of 190/193/206/220. Its annual columns show 2.426 million demand wafers and 2.280 million nominal capacity wafers. Cloud AI accounts for 1.763 million, or 73% of demand. The crop has no report date and every quarter is an estimate. The source label “capacity utilization” means demand divided by capacity; it does not demonstrate saleable output above 100%.

The old model’s USD 22,000 N3 wafer-price proxy implied approximately 283,000 monthly wafers in 2027. That is a different denominator from installed fab capacity. Applying 190,000/283,000 directly to sales would combine unverified scopes. Q2 reported N3 sales of NT$ 320,558.574 million, at 31.6/USD, equal USD 10,144.259 million. Matching those invoices to the image’s 130,000 monthly capacity slots yields about USD 26,011 per nominal wafer slot. This normalizes one observed quarter. It is not a verified wafer ASP, yield estimate or physical output ceiling. Billing lag, inventory, customer mix and tool availability remain unresolved.

Holding that normalization constant gives conditional 2027 N3 sales of USD 13.27/14.44/15.22/16.39 billion, against the reference 15.58/17.71/19.84/21.52 billion. The model keeps the existing 30% joint execution probability. It revises that scenario’s severity by taking the greater of the previous 2%/3% consolidated sales loss and the normalized N3 shortfall in each quarter. The 2027 conditional N3 gap is USD 15.34 billion; USD 4.54 billion was already included in the old joint loss. Only the difference changes expected sales, before linked CPU and price effects.

For 2028, the conditional scenario assumes 220/230/240/250 thousand monthly wafers, adding 10,000 per quarter from the 2027 exit. This 19% increase between year ends is an analyst assumption, not a UBS forecast or issuer commitment. It allows fabs, conversion and productivity to improve output while retaining the old 3% consolidated execution-loss floor. N5-to-N3 tool conversion cannot create capacity in both pools. The model adds no separate, unquantified N5 haircut on top of the combined loss.

Existing pricing is canceled only on incremental unserved N3 sales after deducting the old loss overlap. Incremental CPU capture is deferred by the N3 shortfall divided by reference N3 sales, bounded between 0% and 100%, within the same execution event. This is a workload-allocation proxy, not a claim that the whole CPU wallet uses N3. Its 60% capture probability, 65% gross margin and 8% operating costs remain. The 32 coherent states require both events for these interactions. Price or CPU cancellation occurs only where the corresponding upside event is present. Committed reference capex stays fixed; CPU incremental capex follows its deferred accepted sales.

This lowers expected earnings while retaining the 20x valuation, Base 83, share schedule and opening financial claims. It is a testable capacity-risk update. A dated source, node shipment scope, qualified output, realized mix and tool-conversion evidence can resolve the remaining uncertainty. TSMC Q2 management transcript

User-supplied original UBS Figure 13 crop; source date unknown | Quarter columns are thousands of wafers per month; annual columns are thousands of wafers per year. Demand/capacity above 100% is an estimated load ratio, not demonstrated saleable output. The 2028 catch-up path is absent from this exhibit.

Analytical reconstruction from Q2 reported N3 sales and cropped UBS nominal capacity | The revenue gap is conditional on the calibrated capacity scope. It revises the existing 30% joint execution scenario after removing the prior loss overlap.

Analytical reconstruction from Q2 reported N3 sales and cropped UBS nominal capacity | The revenue gap is conditional on the calibrated capacity scope. It revises the existing 30% joint execution scenario after removing the prior loss overlap.

Gross profit and operating leverage

The model derives gross profit separately for each revenue vector. Those margins are allocations, not reported segment economics. Q3 product margins retain the prior calibration to management's consolidated guidance; later node margins reflect ramp maturation, manufacturing efficiency and a growing service mix. R&D combines aUSD 2 billion quarterly program floor growing3.5% sequentially with2.05% of sales. SG&A combines aUSD 610 million floor growing2% sequentially with0.8% of sales. Incremental branches fund their own extra costs.

N2 ramp and overseas startup dilution are already embedded in the guided starting margin and the reference allocations. The adverse branch adds only costs beyond that baseline. At the unchanged 30% probability, the October 8 revision uses the greater of the previous 2%/3% loss floor and the normalized N3 shortfall in 2027-28. It applies70% lost gross-profit contribution and retains specified fixed/startup costs plus 0.3% extra operating expense. Later quarters keep the prior loss floor. Power delays, package qualification, yield and utilization problems form one joint stress rather than five independent demand shocks.

Capex is not operating expense at purchase. It becomes depreciation as assets enter service, while cash leaves through equipment payments. Ordinary depreciation is already inside the model's gross margin and operating costs; the funding check adds it back once and subtracts cash capex once. Q2 cash capex ofNT$ 496.0 billion

and D&A ofNT$ 198.5 billion demonstrate why the two cannot be substituted for each other.

COUPE and second order beneficiaries

COUPE integrates optical and electronic functions closer to compute and switching. The key manufacturing question is reliable, high-throughput assembly and test. TrendForce's October 7 public preview identifies fiber-array alignment as a constraint and describes3.2 Tbps and6.4 Tbps roadmap stages. These rates are not TSMC revenues, and an optical-interconnect efficiency claim is not a whole-rack power reduction. TrendForce public preview

The model gives a35% probability to a small incremental service opportunity after a50% overlap deduction: conditional sales ofUSD 0.1/0.4/0.9/1.5 billion in 2027-30. Gross margin is50%, incremental operating expense15%, and extra capex30% of revenue. There is no2026 increment because production readiness alone does not specify paid accepted units. The reference already contains substantial backend expansion.

FitTech, Taiwan ticker6706, is the highest-priority new research candidate. Its own FAS product supports optical assembly and passive/active alignment, linking a specific tool to the coupling bottleneck. Revenue depends on accepted machines, throughput, service and customer qualification. The counterweight is reported H1 EPS of negative TWD 2.85. Neither profitable scale nor pricing power follows automatically from the product's relevance. FitTech product TWSE profile

Global Unichip, Taiwan ticker3443, merits medium-priority research for advanced ASIC design and integration. Its issuer page confirms TSMC's35% ownership and sole-foundry relationship. The reported Tesla opportunity remains unverified. Separate NRE/IP earnings from low-margin turnkey wafer pass-through before modeling value. These candidates are research recommendations only; no new Base, target or model is assigned. GUC company profile

ASML and Advantest also merit supplier research. Qualified lithography and increasing test time per good chip can capture spending as foundry constraints are addressed. For ASML, system acceptance and service matter; for Advantest, test parallelism and customer program qualification matter. Customer spending, export restrictions and productivity improvements can reduce the expected benefit. Their current commercial order mix needs a separate review before any score or target. ASML results Advantest engineering update

Competition and thesis failure

Intel and Samsung can win through successful qualification, credible output and attractive customer economics. Samsung's July collaboration with Broadcom is evidence of a serious alternative, but its broad agreement scope includes memory and does not quantify lost TSMC wafer sales. Intel packaging can take backend work while helping customers ship chips still fabricated at TSMC. Packaging competition and wafer competition need separate bridges. Samsung announcement

The active model assigns25% probability to incremental competitive sales losses of 1% in 2028,2% in 2029 and3% in 2030, with65% lost gross-profit contribution and retention costs. Terafab negotiations produce no current contracted revenue in this model: control, scope, funding and qualified timing remain unsettled, with the cited development scenario extending beyond the modeled horizon. The exclusion is a timing and commercial-scope decision, not a dismissal of unofficial evidence.

The thesis weakens materially if customers reduce wafer commitments while capex remains fixed, if N2/N3 good output misses the modeled requirement, or if revenue growth comes with persistently lower economic returns. Additional failure signals include shrinking same-node pricing after concessions, outside manufacturing becoming competitive at commercial yield, and backend growth failing to convert to cash. No generic country discount is imposed; identifiable operating disruption belongs in costs, timing and output.

High NA EUV reaches new readiness milestone
with first high-volume Logic product

“This milestone reflects the close technical collaboration between Intel and ASML and shows how High NA EUV can be integrated into advanced semiconductor manufacturing at scale. By qualifying the High NA EUV process option on select Intel 18A product layers, our existing fleet of tools are providing customers with increased output, while we develop future options to achieve leading-edge performance, density and manufacturing flexibility on upcoming nodes.”

Naga Chandrasekaran, Executive Vice President and General Manager of Intel Foundry.

Financial claims and the ADS denominator

June issued ordinary shares are25,932.370 million. At five ordinary shares per ADS, the entire company has5,186.474 million ADS equivalents. The actual US receipt float is only a subset and must not divide consolidated earnings. The model adds0.1% annual net dilution and uses shares at the end of each four-quarter earnings window. The current active window uses 5,198.151 million ADS equivalents.

At the chosen NT$ 32/USD convention, June cash and current securities totalUSD 109.94 billion. The model reservesUSD 50 billion for operating needs, customer advances, near-term tax/dividend obligations and investment flexibility. Face debt, leases and pensions totalUSD 33.64 billion. This leaves a fixed net financial asset credit ofUSD 26.29 billion. No forecast retained cash is added again. Associates and long-term investment marks receive no separate asset credit in this operating-profit model.

Outside owners receive a small rising share of operating earnings:0.1% in 2026,0.2% in 2027,0.3% in 2028 and0.4% later. This proxy is deliberately above the very small recent group NCI share as minority-owned overseas capacity ramps. Book NCI is not also deducted as debt. The Taiwan ordinary equivalent of the active ceiling is TWD 3,996.17 at the fixed exchange rate, before ADR premiums, fees or investor tax differences.

Cash funding and valuation sensitivities

The cash feasibility schedule uses reference capex ofUSD 62 billion in 2026 including reported H1,USD 80 billion in 2027,USD 94 billion in 2028,USD 106 billion in 2029 andUSD 112 billion in 2030. Positive CPU/COUPE branches require additional investment. These later amounts are model assumptions. A separateUSD 2 billion Sony JV payment is placed inQ1 2027 as a conservative funding sensitivity, without inventing JV revenue or an offsetting asset value. August board decisions

Cash generation uses normal19% taxes, a10% working-capital requirement on incremental sales, cash interest, depreciation addback, dividends and capex. All32 persistent combinations of the five events remain liquid. The joint adverse path has minimum quarter-end liquidity of USD 115.0 billion. This is a funding proxy with debt continuity, not a full maturity-by-maturity cash forecast. An extreme USD 62.109 billion simultaneous payment test leaves USD 47.829 billion immediately, below the unchanged reserve, and USD 52.911 billion at the first modeled quarter end. This deliberately retains reserves and charges already represented by those payments. It is a severe diagnostic, not a forecast financing need.

Active horizon sensitivity	Effect on USD per ADS
One turn of the operating-profit multiple	30.97
One percentage point of OP margin on the active revenue window	10.51
Ten percent more shares with operations unchanged	567.64 ceiling
No surplus cash credit, retaining financial debt claims	612.87 ceiling
All incremental evidence branches set to zero	625.43 ceiling

The first two sensitivities are mechanical, holding other inputs fixed. A full operating change can also affect capacity, funding and costs. The core conclusion is not dependent on a large photonics option or a debt-funded expansion assumption; it depends on a very large, sustained increase in advanced manufacturing demand.

Catalysts and update discipline

The October 11 update incorporates all three Q3 monthly sales releases at the unchanged model FX32. The next checkpoint is Q3 results on October 15, including actual USD translation, product mix, margins, costs, minority attribution and Q4 guidance. Update the actual revenue/margin anchor first, then evaluate the2027 order and capex discussion, qualified N2/N3 output and packaging conversion. Every new price claim must identify its node, eligible contracts, date and realized costs. Changes in aggregate ASP alone are insufficient because mix can explain them.

The immediate research priorities are actual node shipment evidence, the N2/N3 good-output ramp, overseas cash economics and fiber-alignment qualification. The local WK and Morgan Stanley numerical images were unavailable; their relayed bounds are attributed rather than presented as verified originals. The public TrendForce preview was reviewed, not its paid remainder. TSMC binary source downloads were blocked, so redrawn exhibits are explicitly labeled and original external issuer exhibits are identified separately.

Annual operating and funding crosscheck

USD million. All forecasts reconcile to the quarterly schedules. Non-wafer revenue includes advanced packaging, testing, masks and other services; the broader total is not pure CoWoS.

Year	Revenue	Gross profit	Operating expenses	Parent OP	Other revenue reference
2027	226,254.2	150,614.2	18,529.9	131,820.1	40,860.0
2028	290,686.9	193,604.8	22,194.8	170,895.8	57,600.0
2029	342,603.4	225,455.8	25,596.7	199,059.7	71,400.0
2030	380,629.4	251,503.1	28,834.8	221,777.6	79,800.0

The unchanged reference implies89,000/161,000 N2 monthly wafer equivalents and283,000/316,000 N3 equivalents in2027/28 at proxy ASPs. These are invoice equivalents, not reportedphysicalcapacity. TheOctober8 joint execution scenario tests scope-normalizedN3capacity anddefers overlappingCPUoutput; an aggregatewafercountdoesnotprovequalifiedleading-nodeoutput.

Cash feasibility and extreme repayment test

The table uses the same operating forecast with no new net debt or equity. Starting principal is assumed refinanced in the normal path. All32 event combinations remain above the USD50bn reserve at modeled quarter ends.

Quarter	Expected liquidity	Adverse liquidity	Cash capex	D&A addback	Dividends
Q3 2026	115,020.4	115,020.4	17,500.0	7,300.0	5,500.0
Q4 2026	122,873.0	122,873.0	17,700.0	8,100.0	5,500.0
Q1 2027	126,855.8	125,230.0	20,140.2	9,200.0	6,000.0
Q2 2027	135,239.1	131,601.9	20,138.6	9,900.0	6,000.0
Q3 2027	146,747.1	140,512.7	20,136.6	10,600.0	6,000.0
Q4 2027	161,569.1	152,397.0	20,136.3	11,300.0	6,000.0
Q1 2028	173,484.1	161,326.8	23,748.7	12,400.0	7,000.0

Quarter	Expected liquidity	Adverse liquidity	Cash capex	D&A addback	Dividends
Q2 2028	188,574.6	173,402.4	23,749.9	13,400.0	7,000.0
Q3 2028	207,471.7	189,613.4	23,754.3	14,400.0	7,000.0
Q4 2028	229,852.6	209,268.7	23,761.2	15,400.0	7,000.0
Q1 2029	248,441.3	225,074.4	26,847.6	16,400.0	8,000.0
Q2 2029	269,777.5	243,528.0	26,847.6	17,400.0	8,000.0
Q3 2029	294,014.2	264,776.0	26,847.6	18,400.0	8,000.0
Q4 2029	321,365.6	289,036.5	26,847.6	19,400.0	8,000.0
Q1 2030	345,709.1	310,131.4	28,399.4	20,100.0	9,000.0
Q2 2030	372,488.2	333,560.3	28,399.4	20,800.0	9,000.0
Q3 2030	401,928.3	359,533.6	28,399.4	21,500.0	9,000.0
Q4 2030	434,153.0	388,176.3	28,399.4	22,200.0	9,000.0

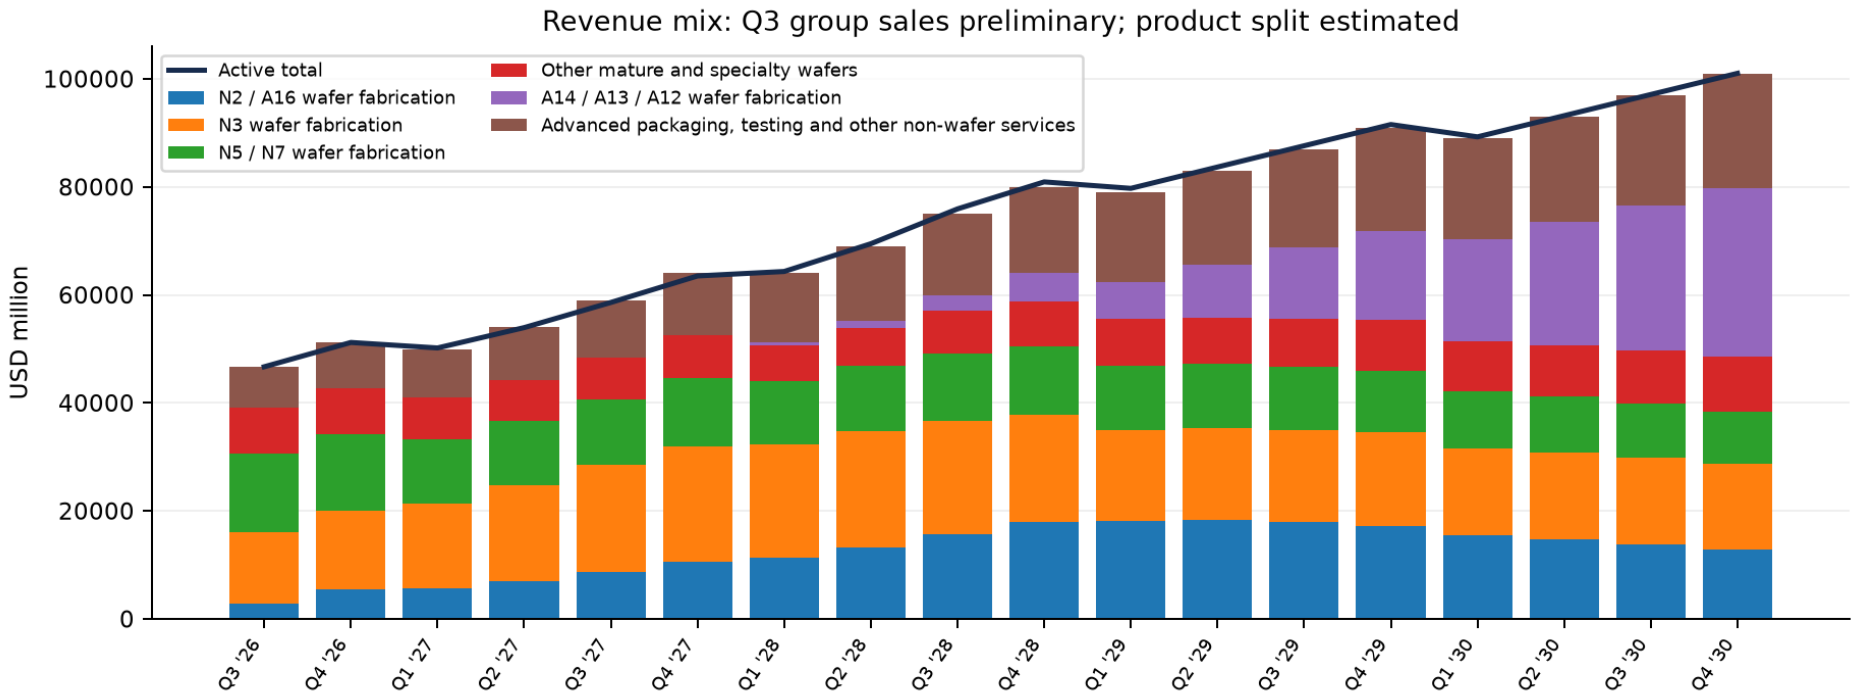

An extreme diagnostic immediately repays all opening face debt, leases, pension, capacity deposits, contract liabilities, tax payable and declared dividends: USD62.109bn. Liquidity falls toUSD47.829bn immediately, below the unchanged USD50bn comparison floor, then exceedsUSD52.911bn at the first modeled quarter end. This intentionally retains reserves and future charges already represented in the payment; it is a severe double-payment bound, not a forecast financing requirement. It does not establish intraperiod cash timing.

Score arithmetic

Category	Points	Evidence / treatment
Core thesis	19	Process/design ecosystem, commercial yield, wafer scale and packaging jointly create a hard-to-replicate qualified supply position.
Cycle	9	AI capacity demand strong into2027; consumers and power readiness limit straight-line extrapolation.
TAM	9	Accelerators, customsilicon, agenticCPUs andadvancedpackaging; wallet and overlap explicitly bounded.
Catalysts	4	October 15 results and guidance, N2/N3 ramps and 2027 pricing; September monthly sales now incorporated.
Macro	9	Broad compute capital formation; neutralcountry baseline.
Alpha	3	The moat is widelyrecognized; alpha rests on earningsconversion andincrementalpricing,not discovery.
Risk classes	-3	Three classes: customer/cycleconcentration;manufacturing/overseasexecution;competitive/technology substitution. Cashfundingdoesnotadd anextra riskclass.
Total	50/60	Rounded Base 83. Both artifact and new workbook row use this score; this is not a manual override.

Revenue and business mix

Reference business vectors sum to the reference; the active total adds only probability-weighted net changes. Product allocations may be analytical proxies where issuers do not report product margins.

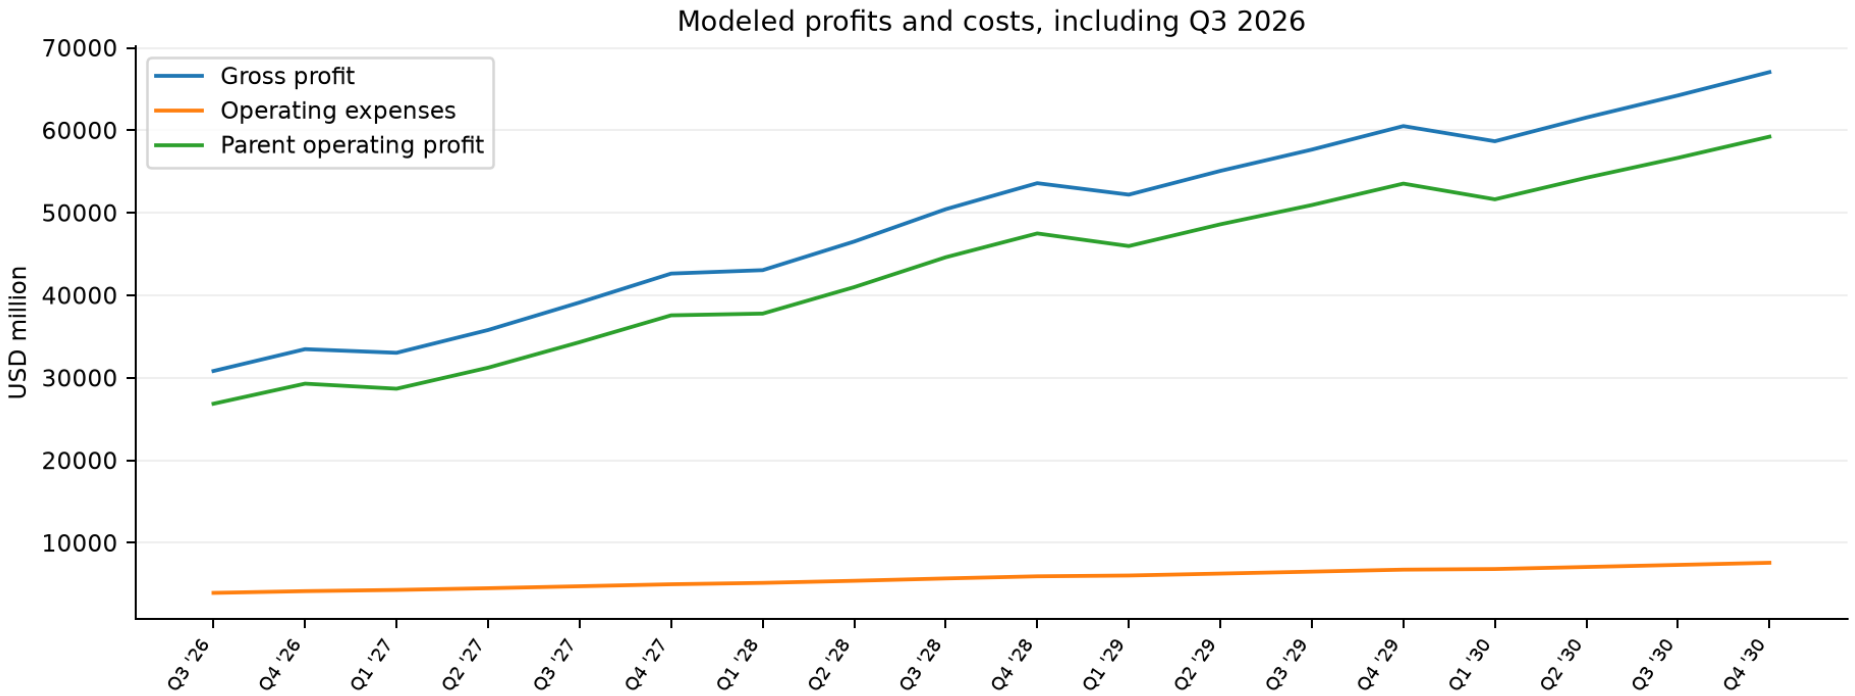

Reference business vectors sum to the reference; the active total adds only probability-weighted net changes. Product allocations may be analytical proxies where issuers do not report product margins.

Quarterly revenue-vector derivation

All rows below are reference inputs. Gross profit = vector revenue x the stated gross margin, except explicitly labeled zero-sales cost credits. The next table applies the separately weighted evidence deltas. A product-level proxy is a model assumption even when the group total is calibrated to guidance or preliminary monthly sales. Q3 2026 product shares, gross margins and implied wafer shipments remain estimates.

Quarter	Revenue vector	Revenue	Gross margin	Gross profit
Q3 2026	N2 / A16 wafer fabrication	2,745.7	50.0%	1,372.8

The categories reconcile to reference operating expenses. Incremental costs below are applied once; depreciation or stock compensation already included in a reference category is not added again.

Probability-weighted financial bridge

Active = reference + sum(probability x bounded conditional delta). Negative deltas are retained. A branch with zero near-term increment remains zero only for the timing or overlap reasons documented in the evidence register.

Weighted OP below is after the stated minority operating-profit attribution. Conditional gross profit and expenses remain consolidated figures.

Consolidated profit to the common shareholder claim

Minority attribution is an earnings allocation, not operating expense or a fixed book-value deduction. Its rate is a disclosed model proxy and moves with reference profit and each probability-weighted change.

Quarter	Consolidated OP	Minority rate	Minority allocation	Owner OP

Enterprise-to-equity reconciliation

20x forward-four-quarter normalized IFRS operating profit attributable to parent, plus fixed opening surplus liquidity less face debt, lease and pension claims, divided by end-window ADS-equivalent shares. Each ADS represents five ordinary shares; Q prices Q plus the next three quarters.

The financial claims shown here are matched to the end of each four-quarter earnings window. Operating-quarter cash and claims schedules elsewhere show balances at their own quarter dates.

Claim decisions, overlap and triggers

PRICE

p: 0.65

classification: Issuer value-pricing policy plus constrained qualified supply; bounded analytical assumption

Conditional: Relayed channel checks suggest 5-10% advanced-node price increases; numerical originals remain unavailable. Adopt 50% eligible/repriceable invoice coverage at a 6% conditional increase in 2027: 3% of reference N2/N3 revenue. The modeled realization is 0%, 3%, 4%, 3%, 2% across 2026-30, bounded by a 0-5% effective price change.

overlap: Node migration is in the reference. Apply same-node pricing only to reference N2/N3 sales, excluding additional CPU and COUPE invoices. Later relays do not create another event. The October 8 joint execution state cancels this contribution on incremental unserved N3 after deducting the prior joint loss. The 65% price probability remains; no new price uplift is added.

bridge: 85% of incremental sales becomes gross profit and 3% funds extra operating expenses. The remainder absorbs materials, fulfilment and concessions. Recognition follows delivery; apply the minority reserve afterwards.

trigger: Contract coverage and realized like-for-like pricing, distinguished from node mix. Reduce for rebates, customer concessions or successful second sourcing.

CPU_CAPTURE

p: 0.6

classification: Management identifies agentic CPU demand; incremental TSMC capture is uncertain

Conditional: Gross incremental customer foundry wallet of USD 8/14/18/20 billion in 2027-30, times 80% capture, times 50% residual after overlap. Conditional net sales are USD 3.2/5.6/7.2/8.0 billion.

overlap: Half of the gross opportunity is already in HPC. Cloud capex or CPU retail price is booked as neither TSMC revenue nor an additional GPU-to-ASIC migration benefit. Within the October 8 joint execution state, defer incremental CPU revenue in proportion to raw N3 shortfall/reference N3, bounded 0-100%, as an allocation proxy. No second CPU demand shock is applied.

bridge: 65% incremental gross margin, 8% extra operating expense and 30% incremental capex. Recognition starts Q1 2027; all amounts are bounded assumptions.

trigger: CPU wafer starts, qualified capacity and accepted deployments. Reduce if CPU growth replaces rather than adds accelerator manufacturing.

COUPE_OPTION

p: 0.35

classification: Technology readiness is verified; commercial units and retained service fees remain uncertain

Conditional: Gross service wallet USD 0.2/0.8/1.8/3.0 billion in 2027-30, less 50% overlap: conditional net sales USD 0.1/0.4/0.9/1.5 billion. No 2026 increment because readiness does not specify accepted paid volume.

overlap: Half is already covered by backend growth. Do not add laser, optical module or OCS vendor revenue to TSMC services.

bridge: 50% incremental gross margin, 15% operating expense and 30% incremental capex. Conditional operating margin is 35% before minority attribution.

trigger: Customer qualification, accepted engines and TSMC service content per unit.

EXECUTION

p: 0.3

classification: Joint output, power, deployment, qualification, yield, utilization and overseas cost stress. October 8 N3 evidence refines severity at the unchanged 30% probability.

Conditional: In 2027-28, use the greater of the old 2%/3% reference-sales loss and the normalized N3 revenue gap. The undated UBS image estimates 170/185/195/210 kwpm in 2027. The analyst catch-up assumption is 220/230/240/250 kwpm in 2028. Q2 2026 N3 sales of USD 10,144.259m divided by 130 kwpm calibrate dollar scope. This is a conditional proxy, not verified good output or a quoted wafer ASP.

overlap: Replace the prior joint sales loss; do not stack another power, packaging, wafer or yield shock. Keep the same 30% event. N5 conversion is not free additive capacity. CPU deferral uses N3 shortfall/reference N3 as a bounded allocation proxy, not a disclosed node exposure.

bridge: Lost reference sales have 70% GP contribution. Retain fixed/startup costs of 1% of reference sales in 2027-28 and 0.8% later, plus 0.3% opex and all reference cash capex. Cancel existing pricing on incremental unserved N3 after old-loss overlap, at 85% GP and 3% opex. Defer incremental CPU revenue proportionally at 65% GP and 8% opex, only where both events occur. CPU incremental capex follows accepted sales. No new scarcity price uplift.

trigger: Resolve the original UBS date and capacity scope, actual N3 invoices and mix, installed versus qualified starts and completions, N5 conversion and regional fab timing. An easing normalized shortfall releases the added constraint; the old joint-loss floor remains.

COMPETITION

p: 0.25

classification: Qualified alternatives can win share; a roadmap or MOU is not accepted commercial capacity

Conditional: No 2026-27 increment. Conditional lost sales are 1%, 2%, 3% of reference revenue in 2028-30.

overlap: Incremental share loss only. Outsourced packaging can help TSMC front-end growth; package diversion is not automatically wafer loss.

bridge: 65% lost gross-profit contribution and 0.2% of reference revenue for additional retention/R&D costs in affected years.

trigger: Qualified customer production, yield, cost and share gains by an alternative supplier.

ZERO_DECISIONS

p: Not an incremental event

classification: Explicit duplicate and accounting exclusions

Conditional: Node migration, N3 tool conversion, CoWoS scale and ordinary AI demand are reference assumptions. VIS disposal gains are outside operating profit. Technology readiness is not accepted output.

overlap: Platform, node and backend views reconcile to one total. N5 equipment conversion consumes N5 capacity. Reposted forecasts are not independent orders.

bridge: No additional profit from these duplicates. TSMC capex is equipment-vendor revenue, not TSMC sales. Preserve bounded nonzero forward branches where economics can be estimated.

trigger: Independent unit, price or cost evidence can change the relevant operating driver.

TSM_LOCAL_01

decision: PRICE probability65%; 50%eligible invoice coverage; capacity levels remain crosschecks pending exact original scope.

source ids: 2107462971093885070 2107463028144738437

gap: Original numerical images I2-I5 are linked-only, not inspected.; End-period versus average capacity and wafer-equivalent definitions.; Repriceable node invoice pool, customer terms, depreciation and overseas ramp costs.

TSM_LOCAL_02

decision: Same PRICE branch, not independent; 2026 capex55B superseded; no70%GM import.

source ids: 2107450986088616366 2107486033659285648

gap: I105 linked-only; no complete original broker note.; Node and package scope, year-end capacity, yield and recognized output reconciliation.; Capex does not immediately create saleable output; engineering and test constraints remain.

TSM_LOCAL_03

decision: Beyond-horizon optionality; probability25%of eventual participation but0modeled2026-30 revenue because binding commercial scope/timing absent and cited ramp after2030. No price/watt extrapolation.

source ids: 2107505201225593334 2107629774973911504 2107713005291012537 2107721071571128709 2107791176929812823

gap: Ownership, scope, process license, funding, wafer customer, governance and qualified ramp date remain unresolved.; No direct revenue bridge from the quoted USD per watt figure without a time and product basis.

TSM_LOCAL_04

decision: Covered in COMPETITION25% branch; no200kchip-loss assertion.

source ids: 2107644867933524377

gap: I232 linked-only; unknown expert, call date and specification context.; Qualified yield, customer tape-out, purchased wafer volumes, pricing and packaging provider.

TSM_LOCAL_05

decision: COUPE_OPTION35% with explicitlyboundedservicewallet andcosts; no whole-rack power inference.

source ids: X-2107809916841025772 TF_COUPLING

gap: Paid remainder unavailable.; Paid engine units, package revenue, TSMC retained scope, external supplier split, qualification timing and yield not disclosed in preview.

TSM_LOCAL_06

decision: Duplicate price evidence; nosecondincrement.

source ids: X-2107897242841383368

gap: M016 linked-only; exact analyst/source and incremental magnitude unavailable.

TSM_LOCAL_07

decision: No companywideyieldchange. Program-specific uncertainty sits within EXECUTION30% branch.

source ids:

gap: No sampled wafer/bin/yield distribution for Jalapeño.; No directly verified TSMC program award or commercial invoice in the Marvell recap.

Remaining bounded uncertainties

- Node-specific wafer ASP, gross margins and qualified wafer capacity are not disclosed. The node allocation and ASPs are explicitly calibrated analytical proxies; verify against each quarterly shipment and margin release.
- NCI participation is geography-specific. The0.1%to 0.4%OP reserve is a bounded proxy, not a corporate ownership percentage or book-equity claim.
- USD/NTD32 is a constant valuationtranslation assumption, not a forecast FXquote. Taiwan ordinary equivalent equalsADRceiling×32/5 and ignores ADRpremium,fees andtaxdifferences.
- 2028-30 forecasts have materially lower visibility. Capacity,startupcost andcustomerpaymentscan change thepath; fullmodelrevision required if liquidityfalls below USD 50Breserve.
- September monthly sales have been incorporated. Q3 actual USD revenue, product mix, gross profit, operating expenses, cash-flow timing and minority attribution remain pending the October 15 results. Existing model FX32 and cost parameters are retained explicitly as estimates.
- Cash schedule assumes refinancing/continuity of starting face debt. An extreme simultaneous repayment test is shown; opening tax/dividend/customer-advance timing is not a fully reconciled treasury forecast. Fixed opening credit avoids adding forecast cash twice.
- The undated UBS image estimates nominal installed N3 capacity; actual qualified capacity, starts/completion timing, multi-die area, yield and invoice mix are unresolved. USD26,011 revenue per nominal wafer-slot is a one-quarter normalization, not a wafer quote or hard physical output bound.
- 2028 N3 catch-up of10kwpm each quarter is an explicit conditional model assumption, not UBS or issuer guidance. CPUdeferral uses an allocation proxy rather than a disclosed node split.

Sources and basis

The current production framework was read before initiation. Source statements are evidence, not instructions. The shared model data drives both this PDF and the linked Excel model; the clean-state editable artifact embeds these same images.
